

FINANCIAL RESOURCE FLOWS FOR POPULATION ACTIVITIES IN 2001

FINANCIAL RESOURCE FLOWS FOR POPULATION ACTIVITIES IN 2001

Foreword

The goals of the International Conference on Population and Development (ICPD) are reinforced by the agreements of other global United Nations conferences of the 1990s and, most recently, by the Millennium Development Declaration adopted by all 189 Member States at the Millennium Summit in September 2000. Indeed, the ICPD goals are essential for meeting the Millennium Development Goals (MDGs).

The ICPD challenge cannot be met without the willingness of all stakeholders - Governments, local communities, the non-governmental sector, the international community and all concerned organizations and individuals - to turn the Cairo recommendations into action. And this cannot be done without additional and sustained resources.

The ICPD Programme of Action estimated that in the developing countries and countries with economies in transition, the implementation of programmes in the area of reproductive health, including those related to family planning, maternal health and the prevention of sexually transmitted diseases, as well as programmes that address the collection and analysis of population data, would cost \$17 billion by the year 2000. Approximately two thirds of the projected costs was expected to come from developing countries and one third, or \$5.7 billion, from the international donor community.

The present report shows that both population assistance and domestic spending for population not only did not reach the ICPD financial goals but decreased since 2000. Indeed, both donors and developing countries are far from reaching the targets: the international community did not mobilize the required \$5.7 billion for population assistance in developing countries, and developing countries did not meet the required \$11.3 billion in domestic funding for their population programmes. International assistance for population activities is only 44 per cent of the Cairo target. While credit is due to developing countries that, as a group, met a large part of their commitment, it should be pointed out that most developing countries are not able to mobilize sufficient domestic resources to implement their population programmes and are dependent upon international assistance.

Much remains to be done to achieve the ICPD goals and the MDGs, but we do not have enough resources to do it. The HIV/AIDS crisis is far worse than expected and infant, child and maternal mortality are still high in many countries. We cannot ignore these issues.

Higher levels of development assistance, including a commitment by donor countries to implement the target of providing official development assistance (ODA) equal to 0.7 per cent of their gross national product (GNP), and to allocate an increasing level of ODA to population and reproductive health, are essential to eliminate poverty, improve social conditions, raise living standards and protect our environment. Financing for development is more than just a mere phrase. It is an imperative. The Monterrey Consensus stated that achieving the internationally agreed goals demands a new partnership between developed and developing countries and that a substantial increase in ODA and other resources is required if developing countries are to achieve the goals.

We would like to take this opportunity to thank the donor Governments, ministries and relevant agencies and organizations of developing countries, as well as NGOs, foundations, multilateral organizations and agencies in developed countries, for providing the information contained in this report. We also wish to thank the UNFPA/UNDP Country Offices for their kind cooperation, the Joint United Nations Programme on HIV/AIDS (UNAIDS) for their continued support and the Netherlands Interdisciplinary Demographic Institute (NIDI) for the excellent collaboration in the data collection.

Thoraya Ahmed Obaid
Executive Director

Glossary of Terms

- **Bilateral Channel.** The bilateral channel includes funds that flow directly from donor Governments to recipient country Governments.
- **Constant Dollars.** Constant dollars are current dollars that have been adjusted to measure a value over a series of years at the prices prevailing during a particular year. In this report, 1993 – the year in which the ICPD cost estimates were made – was selected as the base year.
- **Current Dollars.** Current dollars are dollar figures prevailing at the time of measurement. In this report, current dollars were taken as reported by the organizations surveyed. Non-dollar currencies were converted to US dollars using the International Monetary Fund (IMF) period-average exchange rates for the year the funds were expended for population assistance.
- **Donor Countries.** In this report, donor countries refer to the 21 developed donor countries and the European Union, all of which are members of the Development Assistance Committee (DAC) of the Organisation for Economic Cooperation and Development (OECD). The 21 donors are Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Ireland, Italy, Japan, Luxembourg, The Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. Greece joined the DAC in 1999, but it is not included in this report because it has not yet begun to contribute to population activities.
- **Development Banks.** Development banks include the World Bank and the regional development banks including the African Development Bank, Asian Development Bank, and the Inter-American Development Bank.
- **Final Expenditures.** Final expenditures refer to funds that have been received by developing countries directly from donor Governments or through intermediate donors. The final recipients may be developing-country Governments, national NGOs, or donors' field offices in developing countries. The programmes in which expenditures are made do not necessarily have to be located in developing countries and may include activities, such as research, that benefit more than one developing country or region.
- **Intermediate Donors.** Intermediate donors include multilateral organizations and agencies incorporated into the United Nations system, the development banks, and international NGOs that channel funds for population assistance from the primary donors to the recipients.
- **Multilateral Channel.** The multilateral channel includes general funds that are not earmarked for specific population activities which multilateral organizations receive from developed countries, funds from developing countries, and interest earned on income.
- **Multi-bilateral Channel.** The multi-bilateral (multi-bi) channel includes bilateral funds earmarked for specific population activities that are channelled through multilateral organizations.
- **Multilateral Organizations and Agencies.** In this report, multilateral organizations and agencies refer to the United Nations organizations and agencies, including the Department for Economic and Social Affairs (DESA), Food and Agriculture Organization (FAO), International Labour Organization (ILO), United Nations Children's Fund (UNICEF), United Nations Development Programme (UNDP), United Nations Educational, Scientific and Cultural Organization (UNESCO), United

Nations Population Fund (UNFPA), and World Health Organization (WHO), the World Bank, and the regional commissions, namely, United Nations Economic Commission for Africa (ECA), United Nations Economic Commission for Europe (ECE), United Nations Economic Commission for Latin America and the Caribbean (ECLAC), United Nations Economic and Social Commission for Asia and the Pacific (ESCAP), and United Nations Economic and Social Commission for Western Asia (ESCWA).

- **NGO Channel.** The NGO channel comprises funds from foundations and general contributions to NGOs active in the field of population and bilateral expenditures for specific population activities that are executed by NGOs.
- **Non-Governmental Organizations (NGOs).** Non-governmental organizations are private not-for-profit organizations that operate exclusively in one country (national NGOs) or in more than one country (international NGOs).
- **Official Development Assistance (ODA).** Official development assistance "consists of net disbursements of loans and grants made on concessional financial terms by official agencies of the members of the Development Assistance Committee (DAC) of the Organisation for Economic Cooperation and Development (OECD) and members of the Organization of Petroleum Exporting Countries (OPEC) to promote economic development and welfare" (World Bank, *World Development Report 1995*, Oxford University Press, p. 238).
- **Primary Donors.** In this report, primary donors include 21 developed donor countries and the European Union that are members of DAC, and foundations.
- **Primary Funds.** Primary funds refer to the financial resources contributed by a primary donor for population activities. Primary funds may be provided by a donor either directly to the developing country or to an intermediate donor such as a multilateral organization or international NGO. Primary funds also include self-generated income of intermediate donors as well as contributions which they receive from donor countries that are not members of DAC.

1 Introduction

Financial Resource Flows for Population Activities in 2001 is the fifteenth edition of a report previously published by UNFPA under the title of *Global Population Assistance Report*. The United Nations Population Fund has regularly collected data and reported on flows of international financial assistance to population activities. The Fund's annual *Reports* focused on the flow of funds from donors through bilateral, multilateral and non-governmental channels for population assistance to developing countries¹ and countries with economies in transition. Also included were grants and loans from development banks for population activities in developing countries.

In light of the 1994 International Conference on Population and Development and, at the request of the Commission on Population and Development, UNFPA updated its reporting system and began collecting data on domestic resource expenditures in developing countries in addition to data on international population assistance. This report contains information on international assistance from 1991 to 2001 and domestic resource flows to population activities from 1997 to 2001.

Since 1997, the Netherlands Interdisciplinary Demographic Institute (NIDI), under contract with and in collaboration with UNFPA, has carried out the data collection for the resource flows project. Working with UNFPA, NIDI created a resource-flows database of both donor and domestic resources that is updated regularly. NIDI also carries out evaluation and analysis of the data in collaboration with UNFPA. In addition, UNFPA/NIDI conducted 15 case studies to supplement the information gathered in the inquiry. Based on findings of the case studies as well as on constant feedback from respondents from both donor and developing countries, the UNFPA/NIDI project team reviews the inquiry and continues to refine the methodology and data collection process to develop better estimates of resource flows for population activities. A resource flows Internet site was created in April 1997 with information about the project, UNFPA's annual *Financial Resource Flows for Population Activities*, reports of the case studies, as well as a preview of the latest available data on international population assistance.

Financial Resource Flows for Population Activities in 2001 is intended to be a tool for donor and developing country Governments, multilateral organizations and agencies, private foundations and NGOs to monitor progress in achieving the financial resource targets agreed to at the ICPD. Development cooperation officers and policy makers in developing countries can use the report to identify the domestically generated resources and complementary resources from donors needed to finance population and reproductive health programmes.

¹ All references to developing countries in this report also include countries with economies in transition.

2 Highlights of the Report

- In 2001, primary funds for international population assistance totalled almost \$US 2.1 billion.² If development banks' loans are added, the primary funds totalled \$2.5 billion.
- Total primary funds, including those of development banks, increased 54 per cent from the immediate pre-Cairo period to 1996, from a total of \$1.3 billion in 1993 to just over \$2 billion in 1996. By 1997, however, international population assistance decreased for the first time in the post-Cairo period, to \$1.96 billion. In 1998, this slight downward trend was reversed and international population assistance continued to increase in 1998, 1999 and 2000. In 2000, population assistance stood at \$2.6 billion, roughly 46 per cent of the \$5.7 billion target agreed upon in Cairo as the international community's share in financing the ICPD Programme of Action by the year 2000. In 2001, however, population assistance decreased to \$2.5 billion.
- In 2001, primary funds from the 21 developed countries and the European Union (members of OECD/DAC) totaled \$1.7 billion. The top five donors were: the United States of America, the Netherlands, Japan, Germany and the United Kingdom, accounting for 81 per cent of the primary funds in 2001.
- Population assistance from donor countries represented 3.24 per cent of official development assistance (ODA) in 2001, up from 2.93 per cent in 2000.
- According to the UNFPA/NIDI resource flows survey, a total of 145 countries and territories benefited from international assistance for population activities in 2001. Of the population assistance going to the five geographic regions, sub-Saharan Africa received the largest share of assistance (45 per cent), followed by Asia and the Pacific, which received 30 per cent; Latin America and the Caribbean (14 per cent); Western Asia and North Africa (8 per cent); and Eastern and Southern Europe (3 per cent).
- Almost one third of the total population assistance went to global and interregional activities, such as safe motherhood, maternal health, contraceptive technology research, strengthening reproductive health in communities in crisis, international HIV/AIDS programme development and support, training of health care workers in the prevention and control of HIV/AIDS, development of an HIV/AIDS data base, research development and training in human reproduction, and population information programmes.
- The majority of final donor expenditures for population activities went to STD/HIV/AIDS activities (39 per cent); followed by family planning services (30 per cent), basic reproductive health services (24 per cent); and basic research, data and population and development policy analysis (8 per cent).
- Developing countries are making efforts to mobilize domestic resources for population activities. However, domestic expenditures for population activities declined in 2001. Developing countries are not able to generate the necessary funds to cover the cost of their population programmes. They continue to rely heavily on external assistance to finance programmes.

² All subsequent references to dollars are to US dollars.

Special Theme Box 1

Major Population News Event in 2001

The United Nations General Assembly held a Special Session on HIV/AIDS in June 2001 to address the growing pandemic. Recognizing the devastating scale and impact of HIV/AIDS, 189 Member States met to review the problem in all its aspects as well as to secure a global commitment to enhancing coordination and intensification of national, regional and international efforts to combat AIDS in a comprehensive manner. They pointed out that AIDS constitutes a global emergency and is one of the most formidable challenges to human life and dignity. They noted that people in developing countries were most affected and that women, young adults and children, particularly girls, are most vulnerable. Moreover, the pandemic constitutes a serious obstacle to the realization of the Millennium Development Goals. The Member States adopted a Declaration of Commitment on HIV/AIDS that provides a framework for an expanded response to the global epidemic. It called for, *inter alia*,

- ❑ Leadership at all levels of society for an effective response to the pandemic
- ❑ Prevention as the mainstay of a response to HIV/AIDS
- ❑ Care, support and treatment as fundamental elements of an effective response
- ❑ Respect for human rights and elimination of discrimination against people living with HIV/AIDS
- ❑ Empowerment of women to reduce vulnerability
- ❑ Special assistance to children orphaned and affected by HIV/AIDS
- ❑ Alleviating the social and economic impact of HIV/AIDS
- ❑ Research and development
- ❑ Additional resources

The Declaration of Commitment pointed out that the HIV/AIDS challenge cannot be met without new, additional and sustained resources. It called for an overall target of annual expenditure of between seven to ten billion dollars by 2005 in low and middle-income countries and those countries experiencing or at risk of experiencing rapid expansion of HIV/AIDS for prevention, care, treatment, support and mitigation of the impact of the pandemic. It further called for measures to ensure that the resources needed are made available, particularly from donor countries, and also from national budgets, bearing in mind that resources of the most affected countries are seriously limited. It urged developed countries to strive to meet the targets of 0.7 per cent of their gross national product (GNP) for overall development assistance (ODA) and 0.15 to 0.20 per cent of GNP as ODA for least developed countries as soon as possible. The Declaration called for the integration of HIV/AIDS actions in development assistance programmes and poverty reduction strategies, as appropriate, and encouraged the most effective and transparent use of all resources allocated.

The Declaration also called for the establishment of a global HIV/AIDS and health fund to finance an urgent and expanded response to the epidemic based on an integrated approach to prevention, care, support and treatment. It further called for the mobilization of contributions to the fund from public and private sources with a special appeal to donor countries, foundations, the business community, including pharmaceutical companies, the private sector, philanthropists and wealthy individuals. It called for the launching by 2002 of a worldwide fund-raising campaign aimed at the general public as well as the private sector conducted by UNAIDS with the support of interested partners at all levels.

The Special Session called on all countries to take the necessary steps to implement the Declaration of Commitment on HIV/AIDS in strengthened partnership and cooperation with other multilateral and bilateral partners and with civil society.

3 Methodology

How the Study Was Conducted

Data on donor assistance for population activities presented in this report were gathered with the use of a detailed questionnaire mailed to 179 donor countries, multilateral organizations and agencies, major private foundations and other international NGOs that provide population assistance. A total of 88 organizations responded to the survey of 2001 financial resource flows: 19 donor countries; 11 multilateral organizations; 18 major foundations, 31 international NGOs, 7 universities and 2 development banks. Telephone interviews were conducted, as necessary, for additional information and verification.

Information on domestic resource flows was obtained from responses to questionnaires sent to 92 UNFPA/United Nations Development Programme (UNDP) Country Offices throughout the world, covering some 162 countries. A total of 47 countries provided information, representing 52 per cent of the population in developing countries. In many countries, national staff were recruited to assist the appropriate government authorities and national NGOs in responding to the questionnaires. The staff were instructed to focus on the ICPD "costed population package" and to ensure that only domestic resources were reported. To supplement the information gathered in the inquiry, case studies were conducted in the following countries: Brazil, China, Egypt, Ethiopia, India, Indonesia, the Islamic Republic of Iran, Nigeria, Pakistan, Peru, Poland, Senegal, South Africa, Thailand and the United Republic of Tanzania.

UNFPA used the information gathered from countries that responded to the previous inquiries, reports of the case studies and supplementary data for a few large countries that had not responded or that provided incomplete data to calculate a very rough estimate of 2001 global domestic resource flows for population activities. This figure should be used with caution. Given the concerns of over- and under-reporting, the methodological problems in gathering accurate information, the sensitivity of the data, and the different recording practices, it is simply not prudent to generalize from the responses obtained from 47 countries to all developing countries. Most domestic resource flows originate in a few large developing countries. Most developing countries are not in a position to generate even half of the amount required to fund their national population programmes. They rely heavily on external assistance.

In keeping with UNFPA's mandate to monitor progress towards the implementation of the ICPD resource targets required for financing population programmes in developing countries and countries with economies in transition, this report does not include funds for population activities that benefit only developed countries or funds contributed by developing countries to be expended in other developing countries.

The data collection exercise does not include private-sector financing at the domestic level. Thus far, the only attempts at estimating private expenditures for family planning, reproductive health and STD/HIV/AIDS services have been made while conducting case studies. The findings show that, in some countries, the private sector plays an important role in the domestic resource flow for population activities. A feasibility study regarding the collection of data on private-sector expenditures undertaken by NIDI showed that most available data are partial or incomplete and are often inaccurate and not up to date.

The Mail Inquiry

Six questionnaires³ were used to gather the data contained in this report. To monitor donor assistance, questionnaires were prepared for: (1) primary donors, including donor countries and major foundations; (2) intermediate donors, including multilateral organizations and agencies, international NGOs, research institutions and universities; and (3) international development banks. Donor questionnaires were prepared in English and French. Three questionnaires were prepared for gathering data on domestic resource flows. They included questionnaires for: (1) national consultants who assisted in the data collection; (2) government departments; and (3) national NGOs. Domestic questionnaires were prepared in English, French and Spanish. In addition to detailed instructions on filling out the questionnaire, respondents received an accompanying letter and manual that explained the purpose of the project, provided a definition of terms used and contained a detailed categorization of population activities with examples.

For the international population assistance component, the data collection procedure was structured in such a way as to eliminate double counting in cases where primary funds passed through multiple channels of assistance before reaching the final recipient. All respondents, except primary donors, were asked to provide a breakdown of income by source. This procedure yielded an unduplicated count of total primary funds for population assistance and had the additional benefit of permitting a check for consistency of responses between two respondents, when one indicated the provision of funds to the other. Any discrepancies that were found were the result of differences in timing, definitions or exchange rates. All respondents, including donor countries, were asked to provide a breakdown of expenditures by recipient – whether developing country, multilateral organization or agency, or NGO.

The funds provided by a primary donor to a recipient country in year A are included under "primary funds" and "final expenditures" in year A. The funds provided by a primary donor to an intermediate donor in year A, but spent by that intermediate donor in a recipient country in year B, would be included under "primary funds" in year A and "final expenditures" in year B.

For the domestic resource flows component, great care was taken to eliminate double counting in cases where the same project was reported by different respondents, for example, the Ministry of Population that is funding the project and the national NGO that is executing it. Respondents were also instructed to distinguish between domestic and international sources and to guard against including foreign aid money and development bank loans as domestic sources.

UNFPA and NIDI are constantly seeking to facilitate the process of filling out questionnaires. The project team welcomes comments and suggestions from respondents and tries to address their concerns whenever possible. The questionnaires are carefully reviewed and revised, as necessary, to incorporate respondents' suggestions and to make them easier to complete. Country case studies, including discussions with respondents, also help to improve the phrasing and sequence of questions. Many sections of the questionnaire are sent pre-filled and respondents are asked simply to verify whether the information is still current. Spreadsheets and other electronic means of sending data from respondents' databases are welcome.

To avoid duplication of efforts and maximize cost-effectiveness, as well as to minimize respondent fatigue, UNFPA/NIDI and the Joint United Nations Programme on HIV/AIDS (UNAIDS) coordinated data collection concerning funds for HIV/AIDS activities beginning with a select group of respondents from the 1998 round of questionnaires. Results showed that such collaboration was beneficial to all parties concerned. Collaboration was extended to include all donors in the 1999 round of questionnaires.

³ The questionnaires are available on the resource flows web site (<http://www.nidi.nl/resflows>).

The Costed Population Package

Earlier editions of the *Global Population Assistance Report* recorded population assistance that supported several categories of activities, including family planning programmes, demographic research, policy formulation, population education, and activities focused on women, whenever such activities were relevant to population. In the post-ICPD transitional years, modifications were made to reflect the ICPD costed population package.

The donor and domestic financial resource flows analysed in this report are part of the costed population package as specified in paragraph 13.14 of the ICPD Programme of Action: family planning services; basic reproductive health services; sexually transmitted diseases (STDs)/human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) prevention activities; and basic research, data and population and development policy analysis. To further simplify reporting procedures, UNFPA/NIDI reports on all activities relating to STD/HIV/AIDS, including diagnosis and treatment of STDs and referrals, education and counselling services for STDs, including HIV/AIDS under the STD/HIV/AIDS prevention programme component described in the ICPD Programme of Action. Beginning with the 1999 round of questionnaires, the project began to monitor, for the first time, resource flows for all HIV/AIDS activities, including treatment and care. This decision was made after careful consideration of respondents' comments that distinguishing treatment and care from prevention activities was not possible and that funding for treatment and care constituted only a small proportion of the total funding provided by major donors to HIV/AIDS activities.

Special Theme Box 2

The ICPD Costed Population Package

- **FAMILY PLANNING SERVICES** – contraceptive commodities and service delivery; capacity-building for information, education and communication regarding family planning and population and development issues; national capacity-building through support for training; infrastructure development and upgrading of facilities; policy development and programme evaluation; management information systems; basic service statistics; and focused efforts to ensure good quality care.
- **BASIC REPRODUCTIVE HEALTH SERVICES** – information and routine services for prenatal, normal and safe delivery and post-natal care; abortion (as specified in paragraph 8.25 of the ICPD Programme of Action); information, education and communication about reproductive health, including sexually transmitted diseases, human sexuality and responsible parenthood, and against harmful practices; adequate counselling; diagnosis and treatment of sexually transmitted diseases (STDs) and other reproductive tract infections, as feasible; prevention of infertility and appropriate treatment, where feasible; and referrals, education and counselling services for sexually transmitted diseases, including HIV/AIDS, and for pregnancy and delivery complications.
- **SEXUALLY TRANSMITTED DISEASES / HIV/AIDS PREVENTION PROGRAMME** – mass media and in-school education programmes, promotion of voluntary abstinence and responsible sexual behaviour and expanded distribution of condoms.
- **BASIC RESEARCH, DATA AND POPULATION AND DEVELOPMENT POLICY ANALYSIS** – national capacity-building through support for demographic as well as programme-related data collection and analysis, research, policy development and training.

Source: Programme of Action of the International Conference on Population and Development, para. 13.14.

The growing trend towards integration of services and the increasing use of sector-wide approaches (SWAps), particularly in health and education, make it more difficult to track the level of funding going to the costed population package described in paragraph 13.14 of the ICPD Programme of Action. The realities of data-recording systems are such that many respondents, both donor and developing, have difficulty reporting financial resource flows by the four categories described in the ICPD Programme of Action. Indeed, experience has shown that there are difficulties in disaggregating and differentiating the components of the costed package from the relevant population-related activities that are not included in paragraph 13.14 of the ICPD Programme of Action, especially in integrated development projects. The trend towards integration of services, consistent with the ICPD call for the integration of reproductive health with basic health services, also makes it increasingly difficult to distinguish among the four categories of population activities.

More funds are channelled to population activities than are reported here because many integrated projects include population activities but the funds are not disaggregated by component. A number of donor countries expressed concern that large sums of money for population assistance may go unreported because they are part of integrated health, education or other social-sector projects. A donor task force was set up in 1999 by UNFPA/NIDI to raise awareness of this issue and to provide a forum for the exchange of experiences in estimating the population component in integrated projects which can be applied to total project expenditures to arrive at the resources earmarked for the ICPD costed population package.

Moreover, in monitoring the flow of financial resources for assisting in the implementation of the ICPD Programme of Action, UNFPA has adhered to the classification of population activities of the costed population package described in paragraph 13.14 of the ICPD Programme of Action. The ICPD+5 review process has shown that there has been progress in advancing the Cairo goals. Indeed, although resource targets have not been met, much more has been accomplished than is reported here. Donors indicate that a significant amount of resource flows goes to other population-related activities that address the broader population and development objectives of the Cairo agenda, but have not been costed out and are not part of the agreed target of \$17 billion.

Finally, the data contained in this report are based on responses obtained from the Governments and institutions surveyed. Although every effort has been made to include all organizations that contribute funds for population and reproductive health programmes, it is not always possible to include every institution that provides population assistance. Although outright refusal to provide information is extremely rare, non-response occurs for a variety of reasons. Therefore, the figures included in this report should be treated as best available estimates.

In addition to data collection, NIDI had the primary responsibility for the evaluation and editing of the data as well as the construction of tables, graphs and maps. NIDI examined the questionnaires for completeness, consistency of internal data and consistency of response between donor and recipient respondents. International Monetary Fund (IMF) period average exchange rates were used to convert non-United States currencies into United States currency.

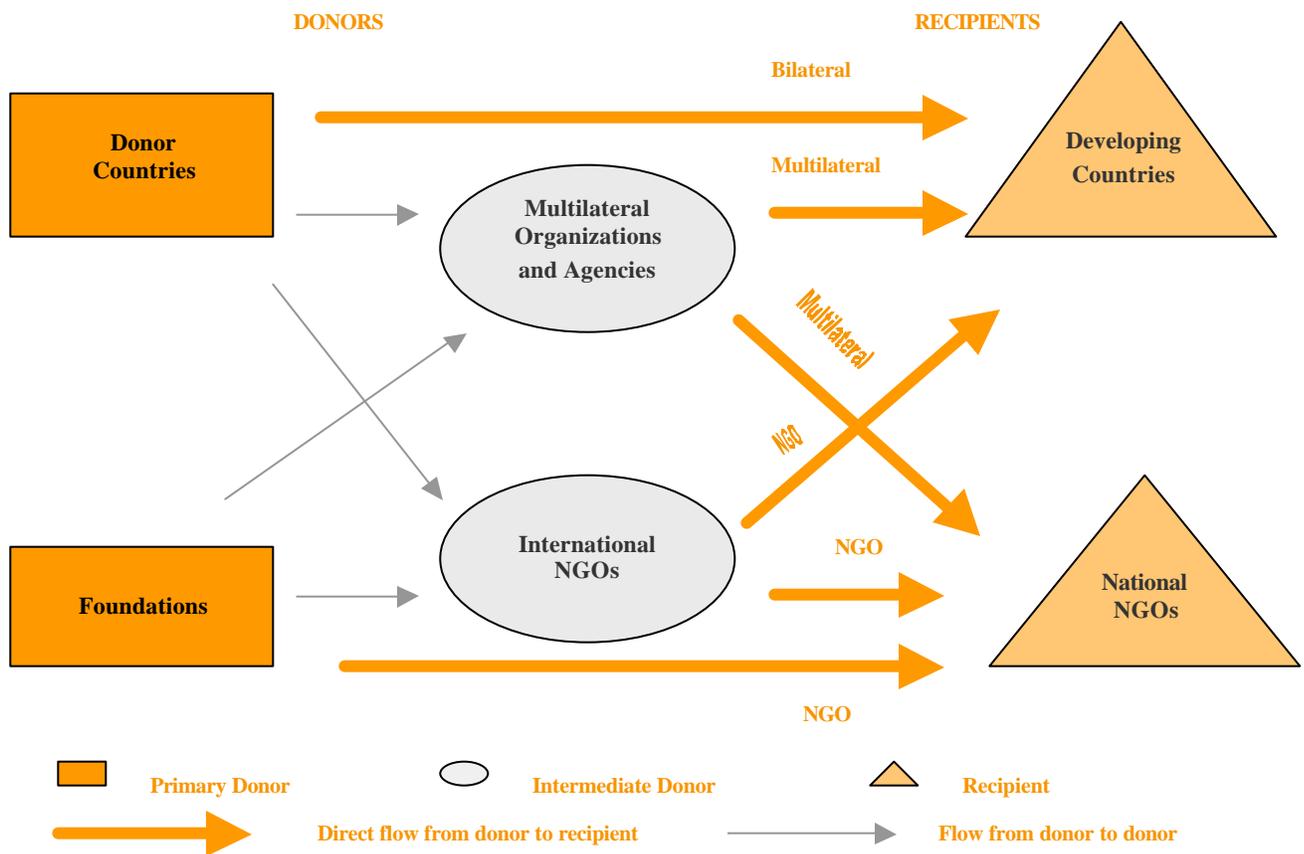

The International Population Assistance Network

Assistance for population programmes flows through a complex network, from donors to recipients through several channels (Figure 1). The channels include: (1) bilateral assistance directly from the donor-country Government to the recipient-country Government; (2) multilateral assistance, through United Nations organizations and agencies and (3) foundations and international NGOs. The international population assistance network includes two groups of donors: (1) primary donors, which are developed countries and private foundations and (2) intermediate donors, which are multilateral organizations and

agencies, the development banks and international NGOs that channel most of the primary donors' funds for population assistance.

At the other end of the population assistance network are two groups of final recipients: (1) developing countries and countries with economies in transition that are the final beneficiaries of the programmes being funded and (2) national NGOs that receive funds for programmes that they themselves execute. Tables A.5 through A.9 provide the final donor expenditures for population assistance in the recipient countries. A total of 145 countries and territories received population assistance in 2001.

Figure 1. Major Flows of Funds for Population Assistance to Developing Countries

4 International Financial Resource Flows for Population Activities

Overview of International Population Assistance

Primary Funds

Table 1 provides an overview of primary funds and final donor expenditures for population assistance from 1991 to 2001. Figures for primary funds reflect the money originating from primary donors in a given year, compared with figures for final expenditures, which reflect the funds provided to a final recipient (developing country Government or NGO) in a given year.

Year	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000 ^b	2001
Primary funds	952	926	966	1,201	1,574	1,535	1,694	1,707	1,691	1,975	2,060
Final expenditures	732	696	610	991	1,325	1,511	1,632	1,681	1,655	1,781	2,051

^a Development bank loans are not included in either the primary funds or the final expenditure figures shown, as the banks' primary funds fluctuate widely. Their primary funds reflect large blocks of loan agreements made in a single year but intended to be expended over several years.

^b 2000 data differ from last year's edition due to additional data received. For primary funds, this change has been minor.

International financial resource flows for population activities – primary funds for international population assistance – totalled \$2.5 billion in 2001 (Table 2). This figure, which includes loans from development banks, decreased from 2000. If development bank loans are excluded, primary funds increased from \$2.0 billion in 2000 to \$2.1 billion in 2001.

Developed countries and the European Union are the largest source of primary funds, accounting for 83 per cent of international financial resource flows for population activities, excluding loans from development banks. Foundations and NGOs contributed almost 12 per cent of the total, and the United Nations system accounted for almost 5 per cent. Less than 1 per cent of international population assistance came from development bank grants.

Trends in Population Assistance in Current and Constant Dollars

In *current* dollars, total population assistance, excluding development bank loans, has grown from \$952 million in 1991 to \$2.1 billion in 2001, at an average rate of about 9 per cent annually (Figure 2). In *constant* dollars adjusted for inflation using 1993 prices – the year in which the ICPD cost estimates were made – international population assistance grew less rapidly than in current dollars, from \$1.0 billion in 1991 to just under \$1.7 billion in 2001, at 6 per cent annually (Table 2 and Figure 2).

Table 2. Primary funds for population assistance, by major donor category, 1991–2001^a

^a Figures were rounded off and may not add to totals. NA indicates information not available for that year.

^b The developed countries category includes the total of UNFPA's income from developed countries, since any contribution to UNFPA is regarded as having been earmarked for population assistance. Beginning with 1994, the European Union is included with developed countries.

^c The United Nations system category includes contributions to population activities, mainly from UNAIDS, UNICEF, UNFPA and WHO that are part of general funds (not earmarked for population activities) from developed countries, developing countries and interest earned on income.

^d Figures for primary funds for population assistance for UNICEF were not provided for 1995. As a result, 1995 figures are estimated at the 1994 level.

^e UNICEF only provided data on project expenditures. Data on income were not provided.

^f UNICEF and WHO did not provide data on income.

^g WHO did not provide data on income.

^h UNICEF did not provide data on income.

ⁱ The selection of 1993 as a base year for indicating constant dollars relates to the ICPD costed package year and serves only to permit an estimate of changes in real values, offsetting fluctuations caused by inflation and exchange rate variations.

^j The development banks' primary funds are shown separately because they are in the form of loans, which must be repaid.

^k The African Development Bank reported approving loans of \$US48 million for broad population and health programmes.

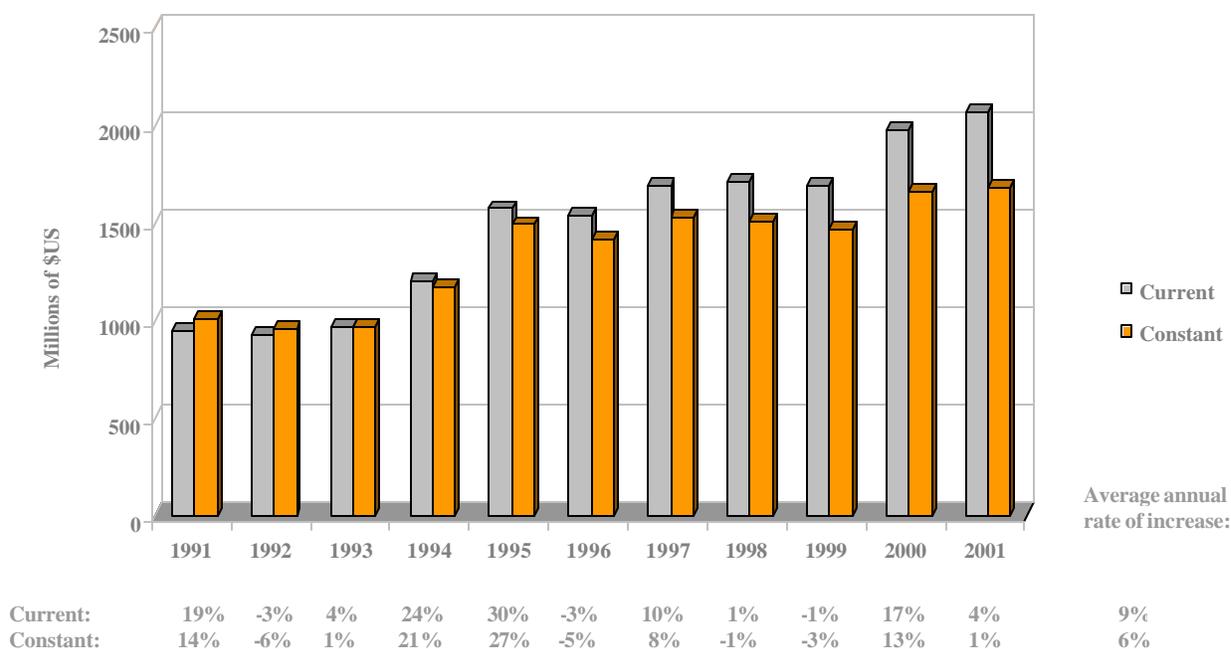

^l The Asian Development Bank reported expending \$US183 million in loans for integrated health projects with a population component.

^m The Asian Development Bank reported expending \$US347 million in loans for primary health programmes for which an undetermined amount was earmarked for population activities.

ⁿ The Inter-American Development Bank reported expending \$US128 million in loans for integrated health projects with a population component.

^o The Inter-American Development Bank reported expending \$US35 million in loans for integrated health projects with a population component. The figure of \$US12 million for population activities is an estimate.

Figure 2. Primary funds for population assistance, in current and constant dollars, with percentage change, 1991 - 2001

Final Donor Expenditures

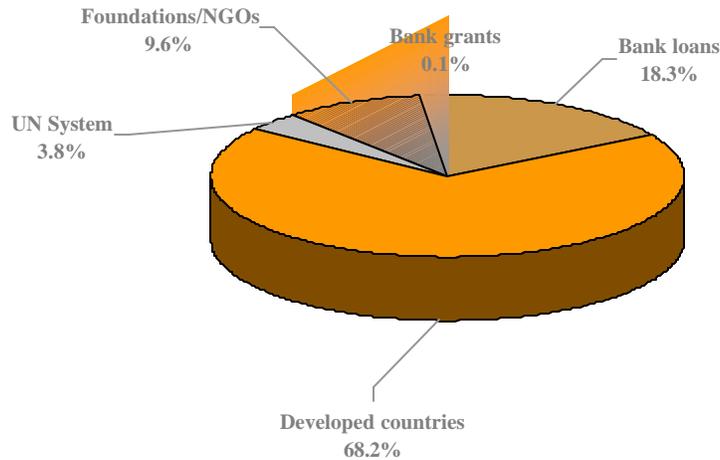

Final expenditures on population projects and programmes in recipient countries in 2001, excluding development bank loans, increased to \$2.1 billion (Table 1).

Trends in Bilateral Resource Flows

Overall Primary Funds

UNFPA monitors international population assistance from the 21 developed countries that are part of the Development Assistance Committee (DAC) of the Organisation for Economic Cooperation and Development (OECD) and, since 1994, that of the European Union. Resource flows from the developed countries and the European Union totalled \$1.7 billion in 2001 and constituted 68 per cent of total resource flows, including development bank loans, or 83 per cent of resource flows excluding loans made available by development banks. Development bank loans accounted for 18 per cent of total population assistance in 2001 (Figure 3).

Figure 3. Primary funds for population assistance, by type of source, in percentages, 2001

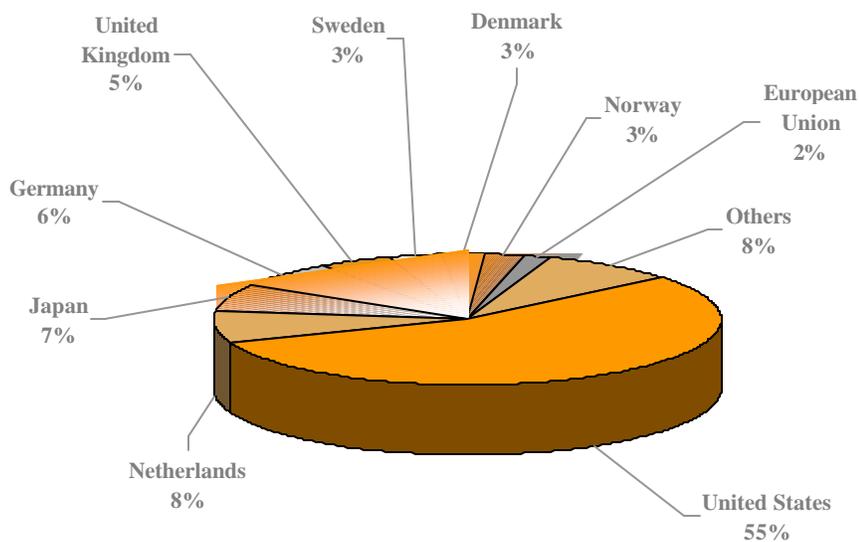

Total: \$US 2.5 billion

Percentages have been rounded off and may not add to 100 per cent.

Resource flows from the 21 developed countries and the European Union increased from \$1.6 billion in 2000 to \$1.7 billion in 2001 (Table 2). Eight countries and the European Union accounted for 91 per cent of population assistance in 2001 (Figure 4).

The United States continued to be the largest donor, contributing \$951 million in 2001, or 55 per cent of the resources of the 21 developed countries and the European Union (Figures 4 and 5).

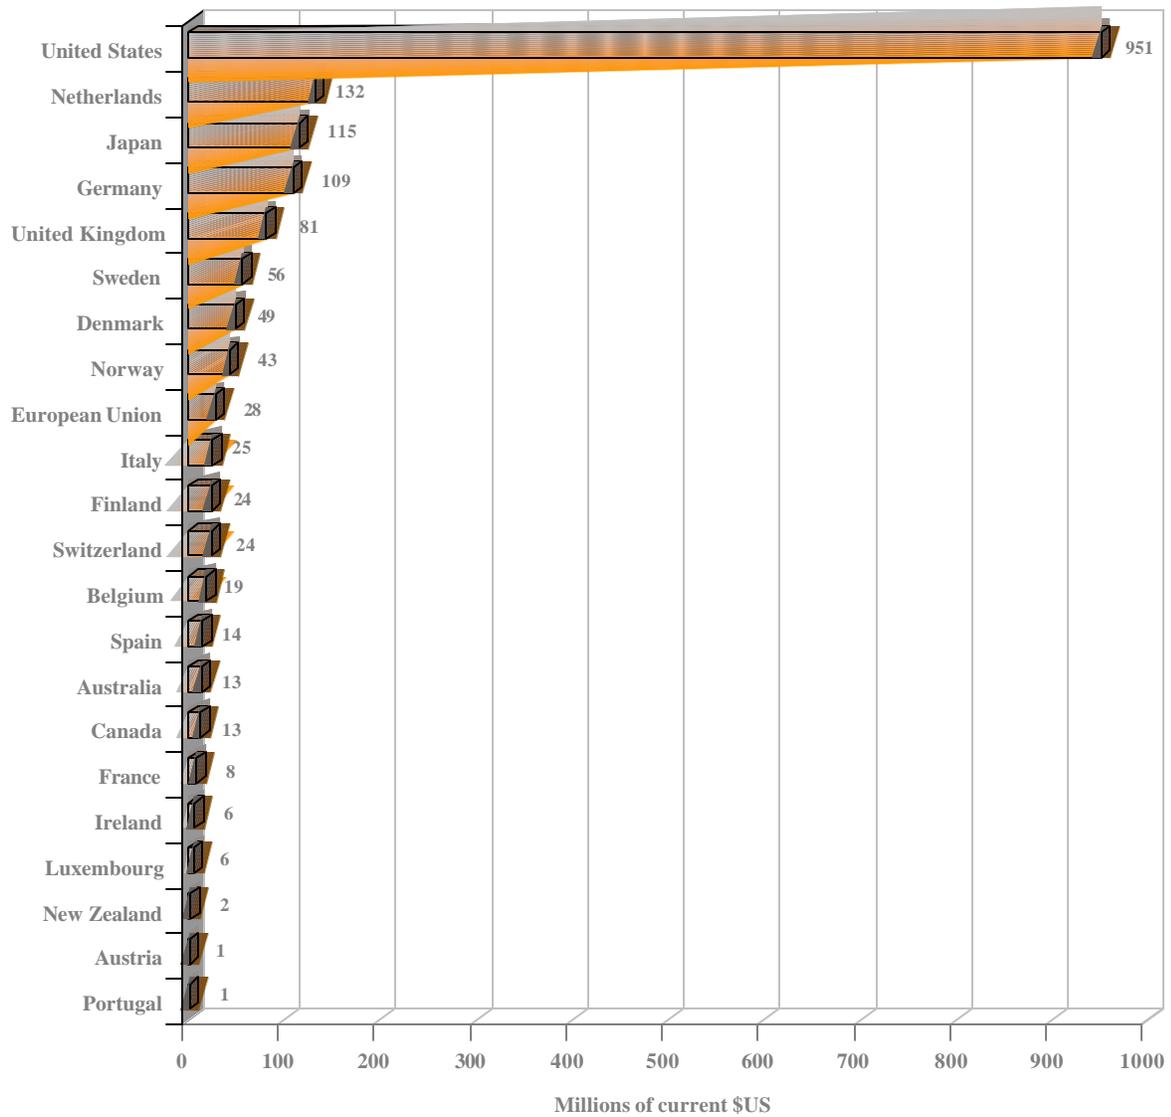

Figure 4. Primary funds of donor countries for population assistance, in percentages, 2001

Total: \$US 1.7 billion

Percentages have been rounded off and may not add to 100 per cent.

Figure 5. Primary funds for population assistance, by donor country, in current US dollars, 2001

- The Netherlands was the second largest donor, contributing \$132 million in population assistance in 2001, or almost 8 per cent of the resources of the 21 developed countries and the European Union.
- Other major donors in 2001 were (in descending order): Japan, Germany, the United Kingdom, Sweden, Denmark and Norway.
- In terms of the United States dollar, 11 donor countries increased funding for population activities in 2001 over 2000 levels (Table A.1). The largest increase in actual dollar amount was from the United States, which provided \$292 million more for population assistance in 2001 than in 2000. Germany provided \$12 million more and Spain provided \$8 million more in 2001 than in 2000. Eleven countries decreased funding in 2001; the largest absolute declines in funding were reported by the United Kingdom (\$89 million), the Netherlands (\$38 million) and Canada (\$25 million).
- Australia and New Zealand increased their population assistance in 2001 but, due to exchange-rate variations, they registered decreases in terms of the United States dollar (Table 3 and Table A1).
- Beginning in 2001, a number of countries have begun to report population assistance in euros.

Special Theme Box 3

Effects of Foreign Exchange Rates

The ICPD financial targets for implementing the population activities that make up the costed population package were expressed in United States dollars. UNFPA continues to use the United States dollar as the standard currency when monitoring progress towards achieving the ICPD resource goals. As a result, some countries that have increased their contributions in local currency may, in fact, be reported as having decreased their population assistance in United States dollars. For example, in 2001, Australia and New Zealand increased their contributions in terms of their local currencies but, owing to the unfavourable exchange rate, they registered decreases in terms of the United States dollar. Using the dollar as a yardstick can make annual funding levels which in local currency reflect consistent Government policy appear as a series of haphazard increases and decreases in aid when converted to United States dollars.

Table 3. Primary funds of donor countries for population assistance, 1996-2001
(Thousands of current local currency)

Donor Country	Local Currency	1996	1997	1998	1999	2000	2001

^a The 1999 figure for Australia includes only expenditures for projects exclusively dedicated to population activities and excludes expenditures for the population component in integrated development projects.

^b Information on expenditures for population projects and programmes was not provided or fully reported. Figures are estimated based on project and programme data from the year 2000.

^c Austria and France reported information only on contributions to multilateral donors in 1999. No information on project expenditures was provided.

^d Euro.

^e Information on expenditures for population assistance was not provided or fully reported; figure is estimated based on the latest year for which data were reported.

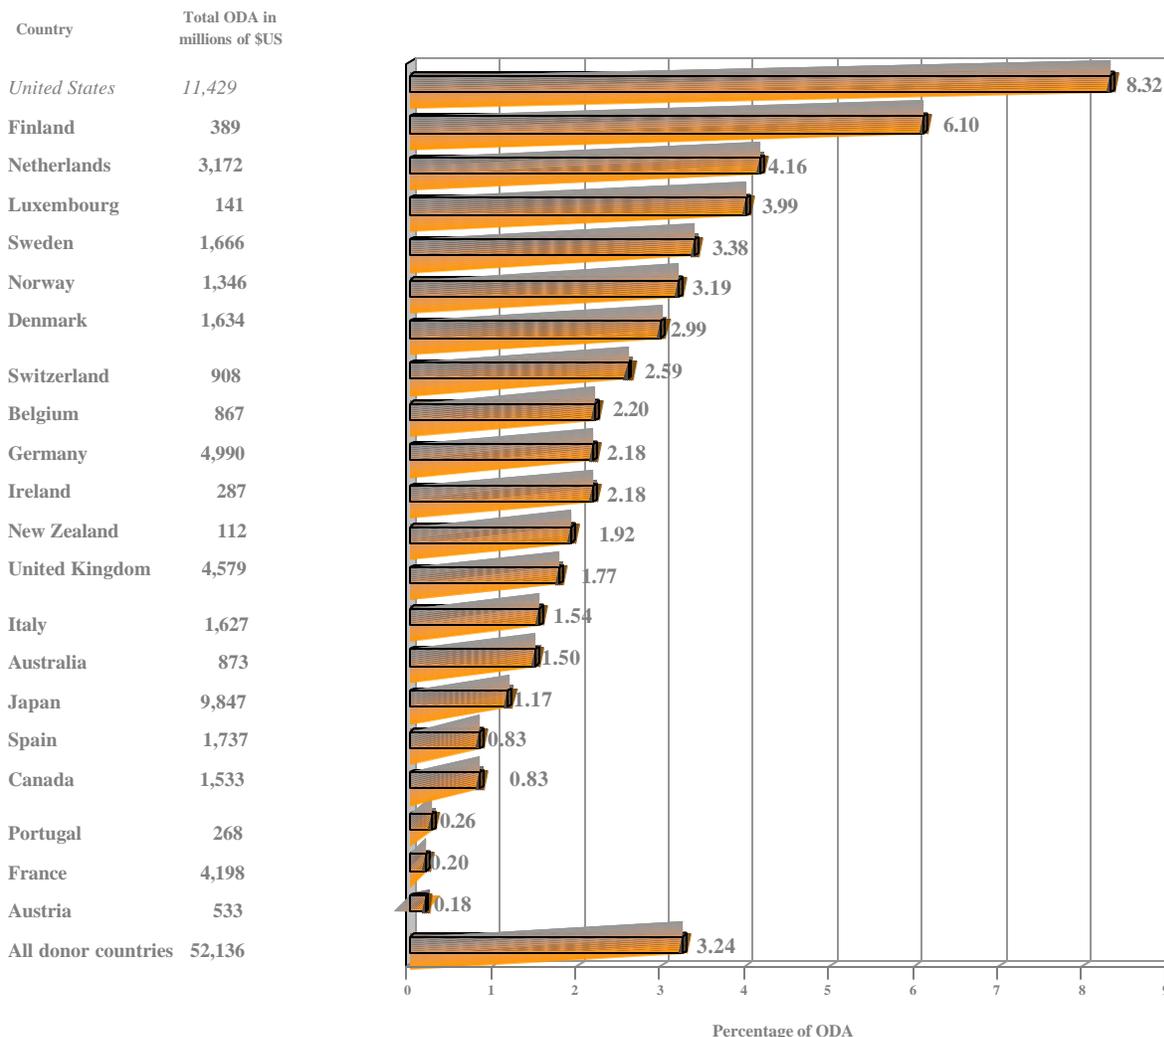

^f United States dollar.

It should be pointed out that a small amount of bilateral resource flows originate in developing countries whose Governments assist other developing countries in the area of population and development. This report focuses only on flows from developed donor countries.

Population Assistance as a Percentage of Official Development Assistance

Donor countries contributed 3.24 per cent of their total official development assistance (ODA) to population assistance in 2001, up from 2.93 per cent in 2000 (Figure 6 and Table A2). However, total ODA decreased from \$53.5 billion in 2000 to \$52.1 billion in 2001. Thus, population activities are, in fact, receiving a larger share of decreasing ODA. The ODA in 2001 was below the 1993 level of \$56.3 billion.

Figure 6. Primary funds for population assistance as a percentage of official development assistance, by donor country, 2001

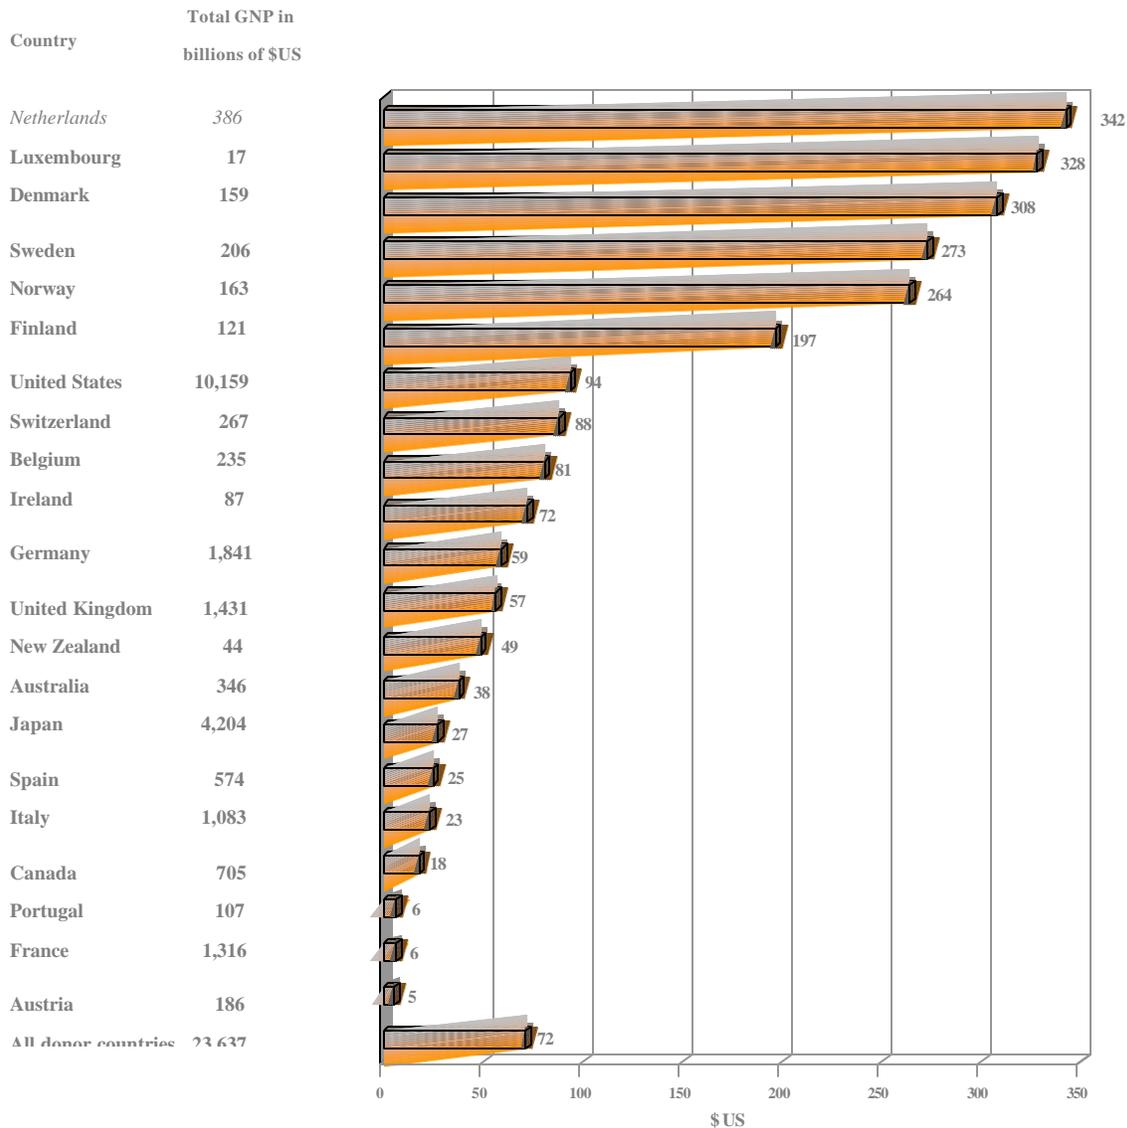

Donor countries vary greatly in the proportion of ODA contributed for population assistance: percentages ranged from 0.18 per cent to 8.32 per cent. Despite stagnating overall funding for population activities, three countries contributed more than 4 per cent of their total ODA for population assistance in 2001: the United States, Finland and the Netherlands. Eleven countries contributed a larger percentage of ODA for population assistance than they had in 2000. The United States led all the major donor countries, earmarking 8.32 per cent of its total ODA for population assistance in 2001.

Population Assistance in Relation to Gross National Product

A country's dedication to population assistance can also be measured by the amount of resources it contributes to population in relation to its gross national product (GNP). In 2001, donor countries contributed, on average, \$72 per million dollars of GNP for population assistance, up from \$66 per million dollars in 2000. (Figure 7 and Table A.3).

Figure 7. Primary funds for population assistance per million \$US of gross national product, by donor country, 2001

The average dollar amount conceals the large variation between countries, from \$5 to \$342 per million dollars of GNP. Six countries spent over \$100 per million dollars of GNP in 2001, and five countries spent less than \$25 per million dollars of GNP. In 2001, the Netherlands led all donor countries in the total dollar contributions per million dollars of GNP to population assistance, earmarking \$342 for each million dollars of GNP for population activities. Denmark, the Netherlands, Norway and Sweden contributed well over \$100 per million dollars of GNP to population assistance each year in the past decade.

Trends in Multilateral Resource Flows for Population Activities

Multilateral assistance to population activities consists of contributions provided by the organizations and agencies of the United Nations system and loans and grants provided by development banks.

The United Nations System

Multilateral sources originating in the United Nations system are mainly funds from UNAIDS, United Nations Children's Fund (UNICEF), UNFPA and the World Health Organization (WHO). Whatever the United Nations agencies receive from DAC member countries for population assistance is considered to be funding from donor countries. Agencies' general funds, interest earned on funds, and money from income-generating activities that are spent on population activities are considered as multilateral assistance for population. Funds received from developing countries which agencies spend on population activities are a small portion of an agency's regular budget and are also included as multilateral assistance. Primary funds from the United Nations system totalled \$96 million in 2001, increasing from \$77 million in 2000 (Table 2).

The significance of population assistance from multilateral organizations and agencies can best be measured by identifying the amount of funds *flowing through* these organizations for further distribution. In 2001, \$480 million flowed through multilateral organizations and agencies. Because they originate with donor countries, these funds are not included under the multilateral category in Table 2 to avoid double counting.

As the leading provider of United Nations assistance in the population field, UNFPA continues to help countries achieve the goals and objectives of the ICPD Programme of Action. In 2001, UNFPA reported a total income of \$396 million as compared to \$367 million in 2000. This includes an income of \$269 million from regular funds, including voluntary contributions of donor governments, and \$128 million from other resources, including trust funds, cost-sharing programme arrangements and other restricted funds.

Special Theme Box 4

UNFPA Assistance to Population Activities

UNFPA has been the leading provider of United Nations assistance in the population field since it became operational in 1969. The world's largest international source of population assistance, UNFPA provides assistance to developing countries, countries with economies in transition and other countries at their request to help them address reproductive health and population issues, and raises awareness of these issues in all countries.

The Fund's main areas of work are: to help ensure universal access to reproductive health, including family planning and sexual health, to all couples and individuals; to support population and development strategies that enable capacity-building in population programming; to promote awareness of population and development issues; and to advocate for the mobilization of the resources and political will needed to accomplish its work. UNFPA is guided by, and promotes, the principles of the ICPD Programme of Action. The ICPD goals, especially those pertaining to reproductive health and reproductive rights, gender equality, women's empowerment and girls' education, are an integral part of efforts to improve quality of life and achieve sustainable social and economic development.

In 2001, UNFPA provided support to over 140 countries: 45 in sub-Saharan Africa, 39 in the Arab States and Eastern Europe, 33 in Asia and the Pacific, and 24 in Latin America and the Caribbean. The largest percentage of UNFPA assistance went to sub-Saharan Africa, followed closely by Asia and the Pacific (roughly 33 per cent for each region), the Arab States and Europe (14 per cent), Latin America and the Caribbean (12 per cent) and Interregional and Global (9 per cent). Seventy per cent of UNFPA assistance went to reproductive health/family planning programmes, 20 per cent to population and development strategies, 9 per cent to advocacy and 1 per cent to multisectoral activities.

As the lead United Nations organization for the follow-up and implementation of the ICPD Programme of Action, UNFPA is fully committed to working in partnership with Governments, the United Nations system, development banks, bilateral aid agencies, NGOs and civil society to ensure that the ICPD goals and objectives are met.¹

¹ See *UNFPA at Work 2001*.

Development Banks

Development banks, which provide loans to developing countries, are an important source of multilateral population assistance. Their contributions are treated separately because their assistance is in the form of loans, which must be repaid, rather than grants. The banks' projects reflect multi-year commitments, recorded in the year in which they are approved, but disbursed over several years. Most loans for population assistance come from the World Bank, which supports such activities as reproductive health and family planning service delivery, population policy development, HIV/AIDS prevention, and fertility survey and census work.

The World Bank's lending for population and reproductive health activities decreased to \$450 million in 2001 from \$538 million in 2000 (Table 2). Of this amount, 78 per cent, or \$349 million, comprised International Development Association (IDA) loans, made at highly concessional rates, and 22 per cent, or \$101 million, comprised International Bank for Reconstruction and Development (IBRD) loans, made at rates closer to those prevailing in the market.

The Inter-American Development Bank provided \$35 million in loans for integrated health projects of which approximately \$12 million was spent on population activities.

In recent years, it has become extremely difficult to disaggregate the population component in integrated projects and to isolate the costed population package from those activities that are not referred to in paragraph 13.14 of the ICPD Programme of Action. Many bank loans are used to finance basic social service programmes such as nutrition, integrated health and girls' education projects. Often, ICPD components such as family planning, reproductive health and HIV/AIDS-prevention services are embedded in these projects. However, record-keeping systems do not disaggregate funds allocated by the four main population categories defined in the Programme of Action. As a result, loans that are used to finance basic social service programmes and which include family planning, reproductive health and HIV/AIDS services go unrecorded because it is not possible to disaggregate funds allocated by the four ICPD categories.

In addition, the World Bank reported an expenditure of \$2 million and the Inter-American Bank reported giving \$1.2 million to intermediate donors for special grants programmes in population in 2001.

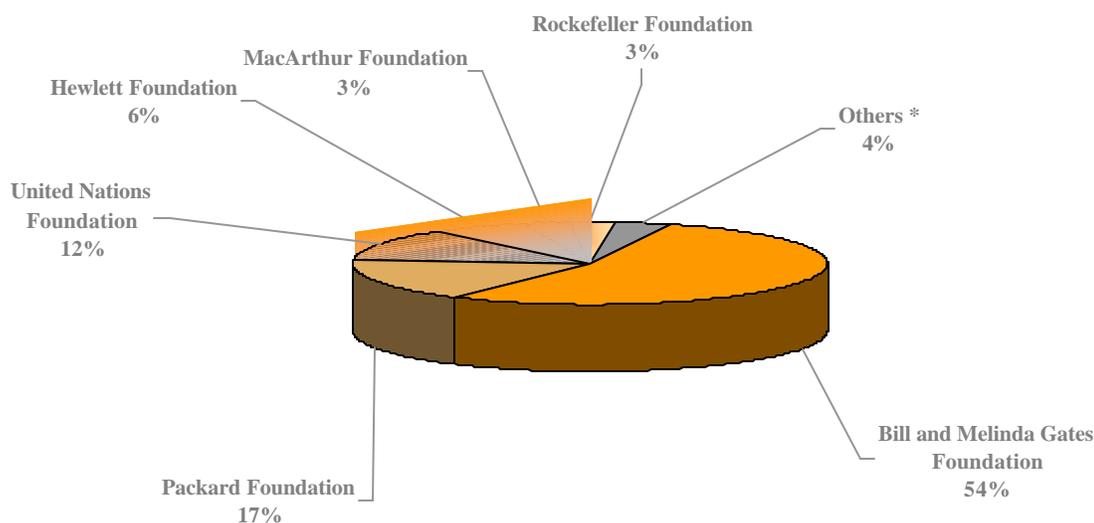

Trends in Resource Flows for Population Activities from Foundations and Non-Governmental Organizations

Foundations, international NGOs and other private organizations are important players in the field of population assistance. Each year, UNFPA/NIDI seeks to obtain information on the amount of funds originating with the major foundations, international NGOs, research institutions, universities and other organizations that are active in the population field. Although most organizations provide the requested information, there are several foundations whose contributions go unreported because there are no responses to the inquiries. Every effort is made to capture all the funds earmarked for population programmes. Together, foundations and NGOs contributed \$241 million for population assistance in 2001, down from \$299 million in 2000 (Table 2).

Major Foundations

Major foundations provided \$202 million in grants for population activities in 2001. The Bill and Melinda Gates Foundation accounted for 54 per cent of the funding that foundations made available for population activities in 2001. Other foundations that provided funds were, in descending order, the David and Lucile Packard Foundation, the United Nations Foundation, the William and Flora Hewlett Foundation, the John D. and Catherine T. MacArthur Foundation and the Rockefeller Foundation. These 6 major foundations, four of which decreased funding levels since 2000, accounted for 95 per cent of the total population assistance from foundations in 2001 (Figure 8).

Figure 8. Primary funds of foundations for population assistance, in percentages, 2001

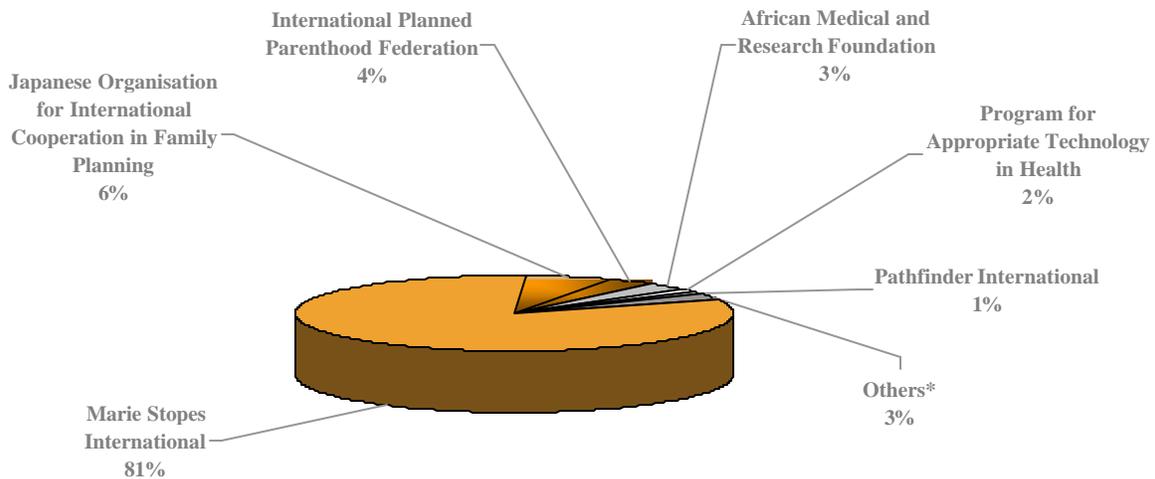

Total: \$US 202 million

* "Others" consists of organizations with primary funds not exceeding 2 per cent of the total.

Non-Governmental Organizations

Although most NGOs serve as intermediate donors that channel funds from primary donors such as Governments and foundations to developing countries, a number of NGOs provide funding for population activities out of their own resources directly to developing-country recipients. In 2001, \$39 million was earmarked for population activities in this way, of which 81 per cent came from Marie Stopes International, 6 per cent from the Japanese Organisation for International Cooperation in Family Planning, 4 per cent from the International Planned Parenthood Federation, 3 per cent from the African Medical and Research Foundation, 2 per cent from the Program for Appropriate Technology in Health and 1 per cent from Pathfinder International (Figure 9).

Figure 9. Primary funds of international NGOs for population assistance, in percentages, 2001

Total: \$US 39 million

* "Others" consists of organizations with primary funds not exceeding 1 per cent of the total.

Final Donor Expenditures for Population Activities

According to the UNFPA/NIDI survey, a total of 145 countries and territories benefited from the \$2.1 billion in final donor expenditures for population activities in 2001 (Tables A.5-A.9).

Final Donor Expenditures for Population Activities by Region

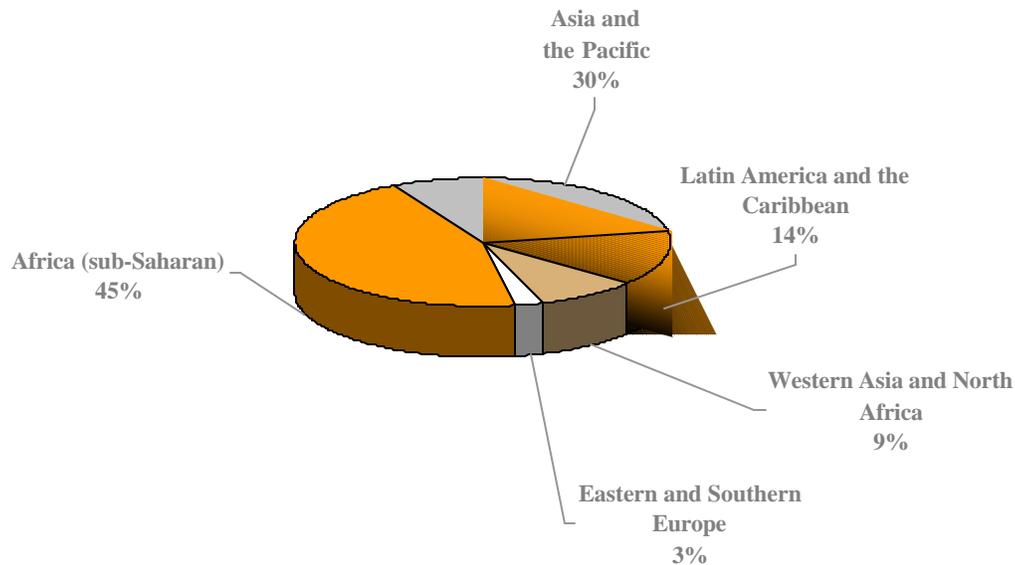

Of the five geographical regions, sub-Saharan Africa was the largest recipient of population assistance in 2001, followed by Asia and the Pacific. The distribution of population assistance among the regions was as follows: sub-Saharan Africa, 45 per cent; Asia and the Pacific, 30 per cent; Latin America and the Caribbean, 14 per cent; Western Asia and North Africa, almost 9 per cent; and Eastern and Southern Europe, 3 per cent.

In recent years, global and interregional population activities received an increasingly larger share of total international assistance, from 18 per cent in the pre-ICPD period in 1993 to 35 per cent in 2001. (Table A.4 and Figure 10). Compared with 2000, the 2001 final expenditures by region were as follows:

- Sub-Saharan Africa – \$605 million in 2001, up from the 2000 level of \$528 million;
- Asia and the Pacific – \$397 million in 2001, up from the 2000 level of \$392 million;
- Latin America and the Caribbean – \$189 million in 2001, up from the 2000 level of \$157 million;

- Western Asia and North Africa – \$114 million in 2001, up from the 2000 level of \$105 million;
- Eastern and Southern Europe – \$35 million in 2001, up from the 2000 level of \$22 million; and
- Global and Interregional – \$711 million in 2001, up from the 2000 level of \$577 million.

Figure 10. Final donor expenditures for population assistance by region, in percentages, 2001

Percentages have been rounded off and may not add to 100 per cent.

Final Donor Expenditures for Population Activities by Channel of Distribution

Assistance for population activities flows from the donor to the recipient country through one of the following channels: (1) bilateral (2) multilateral or (3) non-governmental. Of the total amount spent for population assistance in 2001, over half was spent by international NGOs, while 22 per cent was channelled through multilateral organizations and 18 per cent was channelled through bilateral programmes (Table 4).

- Final expenditures of bilateral organizations totalled \$375 million in 2001, down from \$398 million in 2000;
- Final expenditures of multilateral organizations and agencies totalled \$455 million in 2001, up from \$410 million in 2000; and
- Final expenditures of NGOs totaled \$1.2 billion in 2001, up from \$973 million in 2000.

Table 4. Final donor expenditures for population assistance, by channel of distribution, 1991-2001^a (Millions of current \$US)											
Channel of distribution	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000 ^b	2001

^a Figures and percentages have been rounded off and may not add to grand totals or 100 per cent.

^b 2000 data differ from last year's edition, due to additional information received.

^c The multilateral category does not include development bankloans, as the bank loan agreements are often disbursed over several years.

Figures 11 to 16 indicate the trends in final donor expenditures for population activities by channel of distribution and region. In 2001, over half of all population assistance went through the NGO channel. This was the predominant channel in every region, with sub-Saharan Africa relying most heavily on the NGO channel – in fact, 63 per cent of population assistance in this region was channelled by NGO sources. Eastern and Southern Europe received 59 per cent of its assistance through the NGO channel, Latin America and the Caribbean, and Western Asia and North Africa each received 49 per cent of their assistance through the NGO channel and Asia and the Pacific relied on this channel for 47 per cent of its population assistance.

- In sub-Saharan Africa, the NGO channel grew in popularity since 1994 when, with the exception of 1995, it provided the most population assistance. It peaked at 63 per cent in 2001. The bilateral channel dominated population assistance in 1991-1993 and 1995. The multilateral channel was strongest in 1991.
- In Asia and the Pacific, the NGO channel provided the most population assistance in 1994 and again in 1996-2001. The bilateral channel dominated during the early 1990s and in 1995. The most assistance provided by the multilateral channel was in 1994 (36 per cent).
- In Latin America and the Caribbean, the NGO channel predominated every year in the past decade except in 1995, when the bilateral channel provided the most population assistance. The multilateral channel fluctuated between a high of 31 per cent of final expenditures for population in 1991 and a low of 15 per cent in 2000.
- In Western Asia and North Africa, the NGO channel fluctuated between a low of 15 per cent in 1994 and a high of 59 per cent in 1998. It decreased to 49 per cent in 2001. The bilateral channel provided most of the population assistance except in 1992 and 1998-2001 when the NGO channel predominated. The multilateral channel fluctuated between a high of 36 per cent in 1994 and a low of 17 per cent in 2000.

- In Eastern and Southern Europe, the NGO channel fluctuated in importance from 20 per cent of population assistance in 1991 to 70 per cent in 1994. It stood at 59 per cent in 2001. The bilateral channel was the least important channel in 1992 and 1993 when it accounted for only 7 per cent of population assistance, and strongest in 1996, when it accounted for 58 per cent of assistance. The multilateral channel dominated population assistance in 1991 and 1992 at 55 per cent; it subsequently fluctuated in importance, reaching a low of 11 per cent in 1996, then rebounding, with fluctuations, to 25 per cent in 2001.
- Assistance to global and interregional population activities flowed chiefly through NGO channels. The NGO channel accounted for well over half of the total final donor expenditures for global and interregional activities during the 1990s. The percentage decreased to 49 per cent in 1998 and then increased to 68 per cent in 2001. The bilateral channel accounted for a small percentage of expenditures, while the multilateral channel ranged in importance from a low of 18 per cent in 1994 to a high of 43 per cent in 1993.

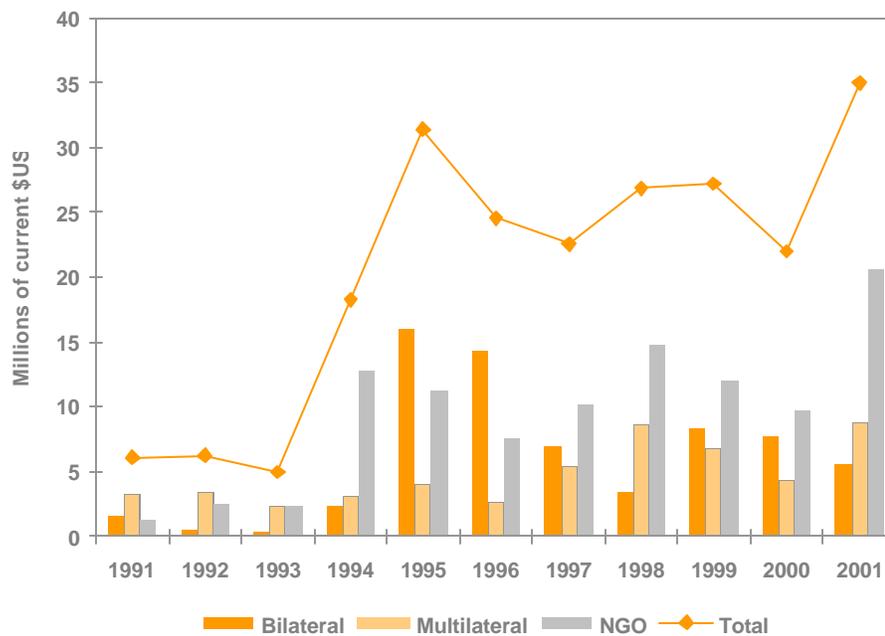

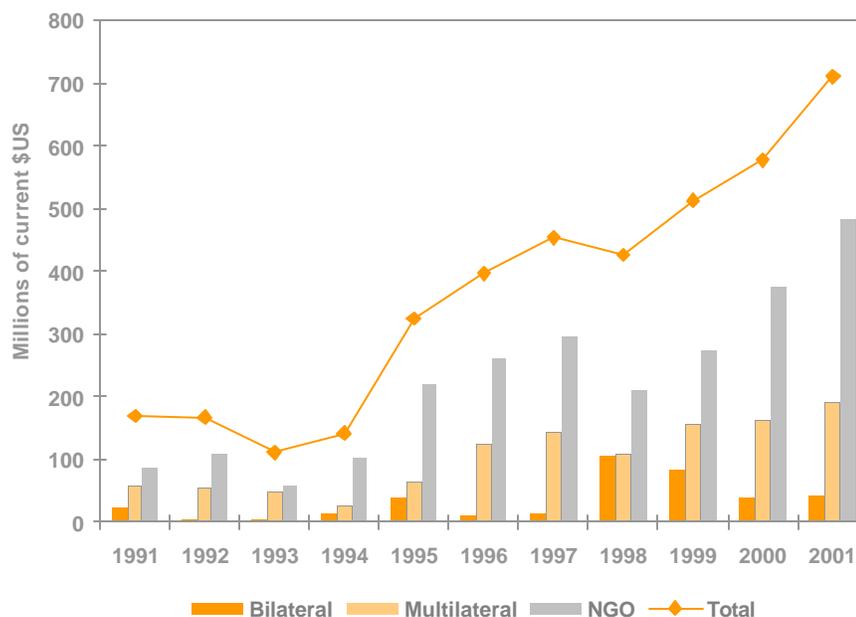

Figure 16. Final donor expenditures for population assistance to global/interregional activities, by channel of distribution, 1991-2001

Final Donor Expenditures for Population Activities by Category of Activity

Well over one third of all population assistance in 2001 was expended for STD/HIV/AIDS activities. A total of 30 per cent of population assistance was expended for family planning services, 24 per cent for basic reproductive health services and 8 per cent was spent on basic research, data and population and development policy analysis. Funding for STD/HIV/AIDS increased steadily since 1995, from 9 per cent of total population assistance to 39 per cent in 2001, consistent with the spread of the HIV/AIDS pandemic. Funding for basic research, data and population and development policy analysis decreased steadily from 1995 to 2001, from 18 per cent to 8 per cent of total population assistance. Consistent with the ICPD call for integration of services, funding for family planning services decreased from 55 per cent in 1995 to 30 per cent in 2001. Funding for basic reproductive health services was more erratic, increasing from 18 per cent in 1995 to 33 per cent in 1996, decreasing to 22 per cent in 1998, increasing once again to 30 per cent the following year, then declining to 24 per cent in 2001 (Table 5). It is possible that this fluctuation is due to the difficulty in reporting of separate expenditures for family planning, reproductive health and STD/HIV/AIDS when these activities are part of integrated reproductive health services.

Table 5. Final donor expenditures for population assistance, by category of population activity, 1995 - 2001^{a,b} (in percentages)+

^e Basic reproductive health care services for Sweden included family planning services.

^f Basic reproductive health care services for Sweden and the United Kingdom included family planning services.

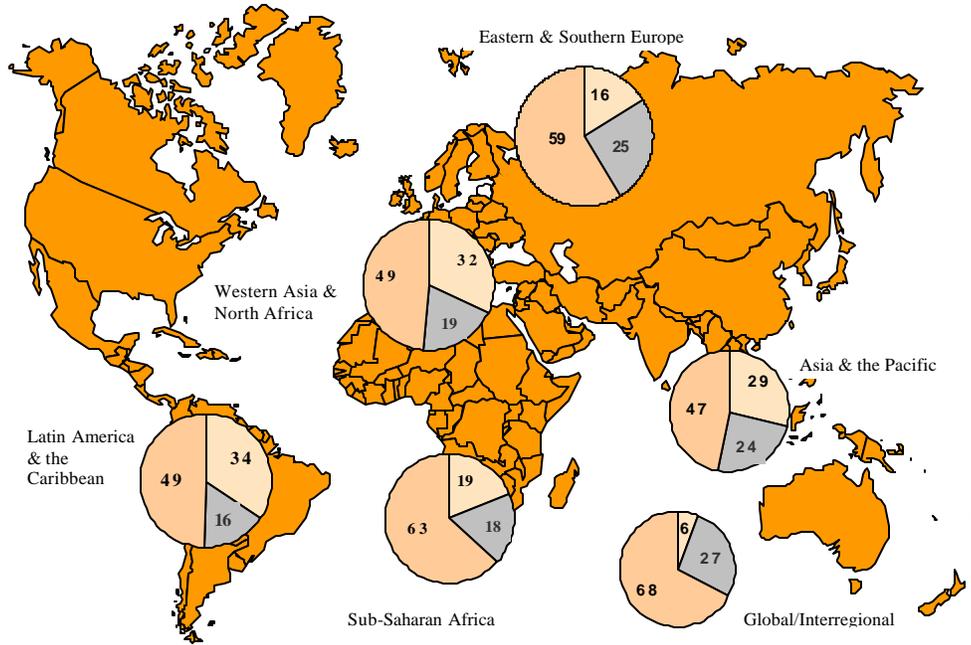

Special Theme Box 5

The Challenge of Monitoring Population Expenditures in Integrated Projects

The growing trend towards integration of services, consistent with the ICPD call for integration of reproductive health with basic health services, and the increasing use of sector-wide approaches (SWAps) in development assistance is posing a challenge for monitoring the level of funding going to the ICPD costed population package.

The realities of data recording systems are such that some respondents are not able to provide expenditures for population activities because they are part of integrated health projects. As a result, many respondents are finding it increasingly difficult to separately identify expenditures for family planning, reproductive health and STD/HIV/AIDS activities because these activities are integrated and the resources are pooled. For example, family planning and STD/HIV/AIDS services are often part of reproductive health services. The Resource Flows project is aware of this dilemma and asks respondents to estimate the percentage spent on each category of population activity where separate expenditures are not available. Some respondents comply with this request, while others are not able to do so. Regional development banks usually cannot provide information on the amount of loans and grants for population activities because they are part of broader health projects.

Note: Percentages have been rounded off and may not add to 100 per cent.

5 Domestic Financial Resources for Population Activities

Response from Countries

Monitoring domestic financial resource flows for population activities is an important part of the UNFPA/NIDI resource flows project. The first systematic attempt to gather data on domestic expenditures for population was in 1997, when the resource flows project collected data for fiscal year 1996. Results were encouraging but information received was far from complete. Many countries did not provide the requested data. Subsequent rounds of data collection produced better results in both quality of data and percentage of population covered. However, respondent fatigue, lack of human and financial resources and difficulty in disaggregating the population component in integrated projects resulted in a disappointing response rate, especially from the more heavily populated countries, for fiscal year 2001 (Table 6 and A.10).

Both the 1997 and 1998 rounds of data collection resulted in a coverage of 80 per cent of the population and the 1999 round resulted in a coverage of 81 per cent of the population. In 2001, the responses covered 52 per cent of the population in developing countries: 61 per cent in sub-Saharan Africa; 53 per cent in Asia and the Pacific; 36 per cent in Latin America and the Caribbean; 62 per cent in Western Asia and North Africa; and 47 per cent in Eastern and Southern Europe. The percentage of the population covered declined considerably from the previous survey in sub-Saharan Africa, Asia and the Pacific and Latin America and the Caribbean because a number of the more populous countries in each of these regions, including Brazil, China, Democratic Republic of the Congo, the Philippines and South Africa, did not reply. The percentage of the population covered increased in Western Asia and North Africa and Eastern and Southern Europe.

The data collection process has now become routine in many of the developing countries. Respondents from both governmental and non-governmental sectors are increasingly aware of the importance of monitoring and reporting domestic resource flows. In many countries, national staff are recruited to assist the appropriate government authorities and national NGOs in responding to the UNFPA/NIDI survey. The staff are instructed to focus on the ICPD costed population package and to ensure that only domestic resources are reported. They are requested not to include international assistance and development bank loans with domestic funding for population programmes.

The UNFPA/NIDI project is focusing more intensively on strengthening the capacity of countries to monitor and collect data on domestic resource flows. In a pilot study testing the feasibility of this approach, a tailor-made user-friendly database was installed in two UNFPA Country Offices and a staff member was trained in data processing and management. The goal is to have a key person in-country responsible for collecting the data and maintaining a relational sub-database that can be transmitted to the main database at project headquarters. Results show that this approach is not feasible in every country because of time and staff constraints as well as the lack of adequate computer capabilities.

Table 6. Percentage of the population covered in survey of domestic resource flows, by region, 1997-2001

Region	1997			1998			1999/2000 ^a			2001

^c Brazil, the most populous country in the region, did not provide expenditure data in 2001.

Special Theme Box 6

Capacity Building for Monitoring Resource Flows to Population Activities

Capacity building is a priority objective of the Resource Flows project. To help ensure sustainability at country level, it is essential to institutionalize the data collection by strengthening national capacity to systematically monitor financial resource flows for population activities. UNFPA plans to increase its efforts in this area by concentrating on a select number of countries with large population expenditures. UNFPA Country Offices will be made aware of the importance of the data collection exercise and the practical uses of the data for budgetary planning and allocations. Data collection will strive to meet national needs in addition to the reporting needs of UNFPA and UNAIDS. Policy makers in developing countries can use the information to identify the domestically generated resources and complementary resources from donors necessary to finance population and reproductive health programmes.

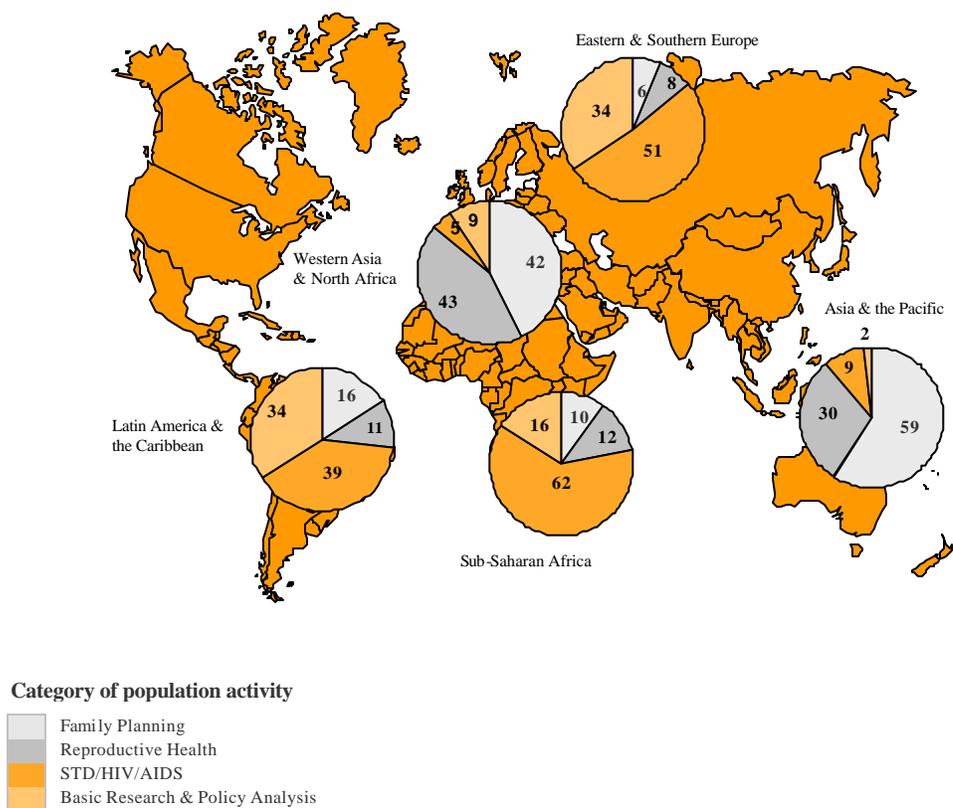

A system that lacks national ownership is unlikely to be sustainable in the longer term once donor funding ceases. It is therefore important to strive for national ownership of data collection systems. Ideally, one organization should be identified to monitor resource flows and its capacity strengthened to carry out this activity. Civil society and especially, women's NGOs, can play an important role in monitoring population expenditures and trying to ensure that Governments achieve financial targets and equity objectives.

Government Expenditures by Region and Category of Population Activity

Based on results from the survey, Governments reported spending almost \$1.5 billion for population activities in 2001 down from almost \$3.5 billion in 1999/2000. The much lower expenditures in 2001 were largely due to the fact that a number of countries with large populations did not reply to the survey for fiscal year 2001. Funding for population in sub-Saharan Africa increased even though a smaller number of countries reported their expenditures than in the previous survey.

Fifty-two per cent of government expenditures in 2001 was allocated to family planning services; 29 per cent to basic reproductive health services; 13 per cent to STD/HIV/AIDS activities; and 6 per cent to basic research, data and population and development policy analysis (Table 7). While the percentages have not changed much since the previous survey (fiscal year 1999), expenditures for family planning services have declined considerably and those earmarked for basic reproductive health services and especially for STD/HIV/AIDS activities have increased as compared to fiscal year 1998. Map 2 provides data on government expenditures by region and category of population activity in 2001.

Map 2. Domestic government expenditures for population activities, by region and category of activity, 2001 (percentages)

Percentages have been rounded off and may not add to 100 per cent.

^a Please note that no domestic survey was conducted in 2000.

Note: Figures are based on countries reporting to the UNFPA/NIDI survey. Percentages have been rounded off and may not add to 100 per cent.

Per Capita Government Expenditures by Region

Governments responding to the survey spent, on average, \$27.94 per 100 persons on population activities in 2001. Government expenditures ranged from \$5.76 per 100 persons in Eastern and Southern Europe to \$34.88 per 100 persons in Asia and the Pacific. Western Asia and North Africa spent \$33.33, Latin America and the Caribbean spent \$14.62 and sub-Saharan Africa spent \$10.33 per 100 persons on population activities (Map 3).

Map 3. Domestic government expenditures for population activities per 100 persons, 2001 (\$US)

Governments spent almost \$15 per 100 persons for family planning services, \$8 for reproductive health services, \$4 for STD/HIV/AIDS activities and almost \$2 for basic research, data, and population and development policy analysis. Countries in sub-Saharan Africa, Latin America and the Caribbean and Eastern and Southern Europe reported spending most of their funding, per 100 persons, on HIV/AIDS activities. Asia and the Pacific spent most of its funding on family planning services and Western Asia and North Africa spent almost an equal amount for basic reproductive health and family planning services.

Source of Income of Non-Governmental Organizations by Region

Results from the 2001 UNFPA/NIDI survey show that 78 per cent of NGO income comes from international sources; and 3 per cent from domestic sources; 19 per cent is self-generated income. The importance of international sources has increased over the years.

Case studies conducted by UNFPA/NIDI confirm that most national NGOs are highly dependent on external sources. For example, approximately one third of the income of national NGOs in Brazil, Egypt, India and Peru was self-generated. However, in China, two thirds of the income originated with the Government.

Non-Governmental Organization Expenditures by Region and Category of Population Activity

National NGOs reported spending \$126 million for population activities in 2001. In sub-Saharan Africa, NGOs reported spending \$38 million; in Asia and the Pacific, \$40 million; in Latin America and the Caribbean, \$42 million; in Western Asia and North Africa, \$7 million; and in Eastern and Southern Europe, less than \$1 million. Despite the fact that less countries replied to the survey in 2001, the NGO expenditures reported increased in two regions: sub-Saharan Africa and Latin America and the Caribbean.

In 2001, national NGOs distributed their funds as follows: 35 per cent for family planning services; 34 per cent for basic reproductive health services; 24 per cent for STD/HIV/AIDS activities; and 7 per cent for basic research, data and population and development policy analysis. Expenditures for HIV/AIDS activities and basic reproductive health services increased, while funding for family planning decreased. Based on responses received, NGOs in sub-Saharan Africa spent most of their funding for HIV/AIDS activities while NGOs in Latin America and the Caribbean and in Eastern and Southern Europe spent most of their funds for family planning services. NGOs in Western Asia and North Africa spent most of their funds for basic reproductive health services while NGOs in Asia and the Pacific spent an almost equal amount on family planning and basic reproductive health services (Table 8).

^a Please note that no domestic survey was conducted in 2000.

Note: Figures are based on countries reporting to the UNFPA/NIDI survey. Percentages have been rounded off and may not add to 100 per cent.

Most domestic resources for population originate with the Government, which plays a major role in financing population programmes in developing countries. However, in some countries, government contributions are mainly in the form of personnel costs and other recurrent expenses such as electricity, water and telephone costs. Other project expenses are funded by international sources. Although their financial role in population activities is minimal, national NGOs play a key role in advocacy, pioneering activities and reaching people at the grass-roots level.

A number of developing countries and countries with economies in transition have shown real commitment to implementing the ICPD Programme of Action. Others have found it difficult to generate the necessary resources to implement national population policies and programmes that reflect ICPD goals. The results of the present survey should be treated with caution. Although every effort is made during the data collection to guard against including external assistance from donors, reporting allocations instead of expenditures, and including non-costed population-related activities, the data that are available at the government and national NGO level do not always meet these criteria. As a result, some estimates are either understated or overstated. Among the problems encountered by Governments and national NGOs responding to the survey are the following: defining population activities, estimating figures for population components embedded in integrated development programmes, distinguishing between international and domestic funds, and providing data at regional and local levels. The UNFPA/NIDI

project staff is working closely with respondents to ensure complete, accurate and timely reporting of data.

Case Studies

The UNFPA/NIDI resource flows project conducts case studies in select countries every year to fine-tune data-collection procedures for estimating financial resource flows for population activities, to provide a better understanding of how resource flows are directed to population activities, to act as a benchmark to study the quality of data gathered through mail surveys in other countries, to monitor the implementation of ICPD goals and to further develop analytical frameworks and indicators for population and development programmes.

The selection of case study countries is made after careful consideration of such criteria as population size, regional balance, role of the private sector and availability of information on resource flows at project headquarters. One or two members of the resource flows team spend an average of three weeks conducting the case study, assisted by a national consultant contracted for this purpose for a period of four weeks. To the extent possible, arrangements are made to meet government authorities within the Ministries of Planning, Population, Health, Finance and other relevant ministries to discuss population policy and expenditures for population programmes. Similar meetings are conducted with major national NGOs. UNFPA/UNDP Country Offices are instrumental in identifying national consultants and the relevant government authorities and NGO representatives as well as providing logistical support in most cases.

To date, case studies have been conducted in the following countries: Brazil, China, Egypt, Ethiopia, India, Indonesia, the Islamic Republic of Iran, Nigeria, Pakistan, Peru, Poland, Senegal, South Africa, Thailand and the United Republic of Tanzania.

The reports of the case studies describe the country's population policy and summarize government and NGO expenditures on population programmes by category of population activity. They also address such issues as the extent to which the policy reflects ICPD recommendations and the Declaration of Commitment on HIV/AIDS, the role of the private sector and major constraints encountered. It is the policy of the UNFPA/NIDI resource flows project to present the results of the case studies to the UNFPA Country Offices for official approval before making them available on the resource flows web site.

The case studies reveal the complexity of gathering domestic data on resource flows in a number of areas that would otherwise not have become readily apparent in a mail survey: sensitivity and confidentiality of information on financial resources, insufficient knowledge of the language in which the questionnaire was written (English, French or Spanish), unorganized bookkeeping, incompatibility between budget documents and information provided in questionnaires, incompleteness of data, difficulty in disaggregating the four categories of the ICPD costed population package, difficulty in estimating the government contribution to population programmes, which is sometimes mainly in the form of personnel costs and other recurrent expenses, and the inclusion of international NGO expenditures. Many of these issues can be clarified during discussions between the project team member, the national consultant and the government or NGO respondent.

A significant issue to arise from the case studies is the effect of decentralization on monitoring domestic resource flows. Some countries, such as Egypt, Senegal and the United Republic of Tanzania, are more centralized, and information on government expenditures for population activities is readily available at the national level. Others, such as Brazil, China, Ethiopia, India, Nigeria, South Africa and Thailand, are decentralized and have separate budgets and monitoring systems at lower government levels. In these countries, resource flow information obtained at the national level may represent a small part of total expenditures for population in the country. Expenditure data must be obtained from each region and

locality within the country to get a complete picture of domestic resource flows for population activities. Current funding, time and staff constraints make this impossible.

Special Theme Box 7

Financial Resource Flows: Highlights of a Case Study in Iran

The ICPD Programme of Action in the Islamic Republic of Iran is implemented within the context of the country's religious and cultural values. The following factors contribute to the success of Iran's current family planning programme:

- Religious leaders play an important role in popularizing the population programme
- The Government is committed to primary health care and population activities
- Existence of an excellent primary health care network in which family planning and reproductive health services are integrated. The network reaches more than 95% of the population (in urban areas nearly 100 per cent of the population through a network of public and private sectors; in rural areas up to 75 per cent of the population through the primary health care system)
- High degree of educational level among females

The annual growth rate in the Islamic Republic of Iran declined significantly from 3.4 in 1986 to below 1.5 in 2000/2001. Total fertility rates were high until the late 1980s (fluctuating between 6.3 and 7.7). Since the inauguration of the new revitalized family planning programme in 1989, fertility fell sharply to almost replacement level in 2000 (TFR is now 2.4). In 1999, the former Minister of Health and Medical Education won the United Nations Population Award for his role in changing Iran's population policy. The current contraceptive prevalence rate is 73.8 per cent.

Family planning and reproductive health activities are completely integrated in the health sector, under the overall responsibility of the Ministry of Health and Medical Education (MOHME). The MOHME manages the state health system, regulates the provision of NGO health care services and is responsible for medical education through an integrated system that combines the health network and universities.

The public sector is the main provider of health care. The primary health care network is a very extensive, integrated and stratified health care delivery system with a good referral system. In rural areas, *health houses* are run by one male and one female community health worker (*behvarz*) and provide basic preventive services. They are supported by rural health centres which provide guidance, supervision and referral services. In order to reach the densely populated poor and newly urbanized neighbourhoods, the MOHME created an organisation of volunteer women health workers, who act as intermediaries between clinics and their neighbourhoods.

The programme is, for all practical purposes, self-reliant: international donors play a minor role in population activities in Iran, accounting for less than 1 per cent of total funding.

Case studies and reports of national consultants show that the private sector⁴ can play an important role in financing population activities in many countries. The UNFPA/NIDI project does not collect data on

⁴ The private sector is defined in the survey as for-profit providers of population services, including commodities (private hospitals; clinics; laboratories; pharmacies and shops; private practitioners, midwives and other health workers charging commercial rates for their services, including commodities). Individual private expenditures include out-of-pocket expenditures for contraceptive commodities paid at commercial outlets; fees for prenatal care; delivery or STD treatment paid at private clinics; employers who fund population programmes and services for their

private-sector expenditures in its annual survey. Attempts at collecting these data have been made while conducting case studies.

Some countries have data on out-of-pocket expenditures for family planning, but few have information on private expenditures for reproductive health and STD/HIV/AIDS services and commodities. Expenditure information does not always fall clearly into one of the four costed population categories; for example, condom purchase can either be for family planning purposes or for the prevention of STD/HIV/AIDS. Moreover, it is often difficult to distinguish clearly between contraceptives supplied by the Government, by donors and by private sources. There is little information on expenditures by employers and private health-insurance companies; in most countries, these constitute only a small part of total private expenditures.

Global Estimate of Domestic Resource Flows

UNFPA calculated a rough estimate of the global domestic resource flows for population activities based on the information obtained from the countries that responded to the UNFPA/NIDI survey, reports of the case studies and supplementary data for a few large countries that either had not responded or had provided incomplete data.⁵ This estimate, which should be treated with caution, yielded a crude global figure of almost \$6.2 billion. An existing estimate of the proportion of private resources in the domestic total (14 per cent), or \$862 million, was added to reflect private resources. This brings the global total for domestic resource flows for population activities in 2001 to \$7 billion.

Although the global figure of domestic resource flows is a rough estimate based on data that are sometimes incomplete and not entirely comparable, the information is useful in that it provides some idea of the progress made by developing countries, as a group, in achieving the financial resource targets of the ICPD Programme of Action. While the global total shows real commitment on the part of developing countries and countries with economies in transition, most domestic resource flows originate in a few large countries. Many countries, especially those in sub-Saharan Africa and the least developed countries, are simply unable to generate the necessary resources to finance their own national population programmes. Case studies confirm that, to a large extent, developing countries are dependent on the international donor community to finance population activities.

UNFPA/NIDI continue to work on refining and fine-tuning the methodology used in preparing the global estimate. Until a more reliable estimation method is in place, the only estimates that can be made with some degree of confidence are those based on actual responses to the surveys as reported by Governments and NGOs themselves. Even these figures are subject to under- or over-reporting for reasons beyond the project's control. The information is simply not available to estimate a global figure on domestic resource flows with any degree of accuracy. Given the concerns of under- and over-reporting, the methodological problems in gathering accurate information, the sensitivity of the data, and the different recording practices, it is not prudent to generalize results obtained from a survey to all developing countries. As additional case studies are conducted in key countries, it is hoped that the official figures obtained from government and NGO sources will replace the estimates, thus providing a more accurate picture of domestic resource flows. It cannot be overemphasized that the domestic figures presented in this report, especially the global total, should be treated as crude estimates.

own employees; and private health-insurance companies that pay providers for population services supplied to individuals.

⁵A simple estimation method was used to calculate the global figure of domestic resource flows. Results of the 2001 UNFPA/NIDI survey were supplemented by reports of the UNFPA/NIDI case studies and other sources, as available, including data from previous rounds of questionnaires, resulting in a coverage of 90 per cent of the population. Regional estimates of domestic resource flows were extrapolated based on 2001 population data and summed to yield a global total of government and NGO expenditures for population activities.

6 Conclusion

Financial Resource Flows for Population Activities in 2001 provides information on the flow of international and domestic funding for population programmes in developing countries. The report represents a major effort to capture funding for activities that are part of the costed population package identified in the ICPD Programme of Action: family planning services; basic reproductive health services; STD/HIV/AIDS prevention activities; and basic research, data and population and development policy analysis. It records bilateral, multilateral and NGO assistance to developing countries, including development bank loans, and provides information on resources mobilized by developing countries themselves.

The data presented in this report are based on responses obtained from the Governments and institutions surveyed. While information on international population assistance is reliable, that for developing countries is incomplete due to the difficulties that many countries encounter in providing the requested data. Data on domestic resource flows, especially the global total, should be treated as approximations. They are meant to provide some idea of the progress that developing countries, as a group, are making towards achieving the ICPD financial targets.

Both donor and developing countries have indicated that they are finding it increasingly difficult to provide the information requested on resource flows for population activities disaggregated by the four categories costed out in the ICPD Programme of Action because their expenditures on those activities are often part of integrated health and social sector projects and SWAps and do not appear as separate budget items in their accounting systems. Other factors that make it difficult to respond to the resource flows survey include respondent fatigue and financial, staff and time constraints. As a result, each year fewer respondents provide the information required to adequately monitor progress towards achieving the financial targets. More external and domestic resources are provided for population activities than are reported here because respondents cannot supply the information requested. UNFPA is looking into alternative ways of capturing expenditures for population, including estimating funding where information is not available.

Progress in Resource Mobilization

The ICPD goal of mobilizing \$17 billion for population activities by the year 2000 has not been met. The international community has not mobilized the required \$5.7 billion in 2000 for population assistance in developing countries and developing countries have not generated the required \$11.3 billion in domestic funding for their population programmes.

Both international population assistance and domestic resource flows have declined since 2000 and are far from reaching the Cairo targets. In 2001, international population assistance was roughly 44 per cent of the \$5.7 billion target agreed upon in Cairo as the international community's share in financing the ICPD Programme of Action by the year 2000. Most domestic resource flows originate in a few large countries. The majority of developing countries have limited financial resources to utilize for population and reproductive health programmes and cannot generate the required funds to implement these programmes.

A number of developing countries have shown commitment to implementing the Programme of Action by formulating new, or revising existing, national population and development policies in line with

Conference goals, implementing population programmes, and allocating resources for population activities. According to the 1998 report on the 20/20 Initiative⁶, which addresses many population-related activities, developing countries allocated, on average, about 13 per cent of their national budgets to basic social services; donor countries spent about 10 per cent of ODA to support these services.⁷ More recent data suggest that funding for basic social services is rising, accounting for around 15 per cent of bilateral donor allocations, with a number of countries reaching the 20 per cent target.⁸

The UNFPA global estimate of domestic resource flows conceals the great variation that exists among countries in their ability to mobilize resources for population activities. Most developing countries cannot be expected to generate the required funds to implement their population programmes. In the least developed countries and other low-income countries, a relatively larger part of the total required resources will have to come from external sources.

The lack of adequate funding remains one of the chief constraints to the full implementation of the ICPD Programme of Action.

Resource Flows for Other Population-Related Activities

The ICPD Programme of Action outlines a comprehensive population and development agenda. It points out that, in addition to the costed population package, additional resources would be needed to support programmes that address broader population and development objectives including, *inter alia*, those designed to strengthen the primary health-care delivery system, improve child survival, provide emergency obstetrical care, provide universal basic education, improve the status and empowerment of women, generate employment, address environmental concerns, provide social services, achieve balanced population distribution and address poverty eradication (paras. 13.17-13.19). No attempt was made to cost out the resources required to achieve these wider social goals.

In monitoring the flow of financial resources for assisting in the implementation of the ICPD Programme of Action, UNFPA has adhered to the classification of population activities of the costed population package described in paragraph 13.14 of the Programme of Action. Funding for other population-related activities, such as basic health, education, poverty eradication and women's issues, is not included in the calculations of international population assistance and domestic resources for population activities.

Both donor and developing countries have indicated that a significant amount of resource flows goes to other population-related activities that address the broader population and development objectives of the Cairo agenda, but that have not been costed out and are not part of the agreed target of \$17 billion. Among the population-related activities that countries supported include: poverty alleviation, primary health-care delivery systems, child health and survival, basic education, including girls' and women's education, empowerment of women, rural development, and income generation. Clearly, countries are spending much more than is included in this report.

New Modalities for Resource Mobilization

Additional resources are needed to fund population and development programmes in developing countries. There are many modalities by which to mobilize resources: advocacy for increased funding from international financial institutions and regional development banks; increased involvement of the

⁶ An initiative whereby donors commit themselves to allocating 20 per cent of development assistance, and developing countries agree to allocate 20 per cent of their development funds, to improving basic social services.

⁷ See *Implementing the 20/20 Initiative*, a joint publication of UNDP, UNESCO, UNFPA, UNICEF, WHO and the World Bank (1998).

⁸ See UNDP, *Human Development Report 2003*.

private sector; selective use of user fees; and social marketing, cost-sharing and other forms of cost recovery. The SWAp is another important mechanism for generating funds for population programmes in developing countries. By changing the way of conducting the aid business and reducing aid fragmentation, the SWAp modality is an attempt to overcome the shortcomings of the project approach to improve the impact and sustainability of development cooperation. It is essential to ensure that population concerns are adequately addressed in SWAps and that sufficient resources are allocated to fund population programmes that are part of sector-wide approaches. Continued implementation of the 20/20 Initiative to provide increased resources for broader poverty eradication objectives, including population and social-sector objectives, is also necessary.

Future Resource Requirements

The ICPD called upon the international community to “achieve an adequate level of resource mobilization and allocation, at the community, national and international levels, for population programmes and for other related programmes, all of which seek to promote and accelerate social and economic development, improve the quality of life for all, foster equity and full respect for individual rights and, by so doing, contribute to sustainable development” (ICPD Programme of Action, para. 13.21).

The Programme of Action specified the financial resources, both domestic and donor funds, necessary to implement the population and reproductive health package over the next twenty years. It estimated that in developing countries and countries with economies in transition, the implementation of programmes in the area of reproductive health, including those related to family planning, maternal health and the prevention of STDs, as well as programmes that address the collection and analysis of population data, will cost \$17 billion by the year 2000. Approximately two thirds of the projected costs in developing countries were expected to come from domestic sources and one third, or \$5.7 billion, from the international donor community.

The actual resources mobilized were far below the agreed targets. Although considerable progress has been made and funding for population has increased since Cairo, the financial resource target for 2000 has not been met. In fact, both international population assistance and domestic expenditures declined in 2001. Action is required on the part of both donor and developing countries to fulfil their financial commitments and to mobilize additional resources needed to fully implement the ICPD goals.

Donor and developing countries should re-examine priorities and increase allocations for population and related sectors. Given limited financial resources, it is essential that donor countries, international agencies and recipient countries continue to strengthen their efforts and their collaboration to avoid duplication, identify funding gaps and ensure that resources are used as effectively and efficiently as possible. Coordinating donor financing policies and planning procedures would help to enhance the impact and cost-effectiveness of contributions to population programmes.

More emphasis on results-based programming and management on the part of development and multilateral agencies will help to increase donor confidence which may, in turn, increase development assistance and provide agencies with the funds necessary for them to carry out their work. Assessing impact of resources, examining cost-effectiveness and addressing equity considerations will also help to alleviate the concerns of an increasing number of donors in an era of economic instability and lagging donor assistance.

The ICPD goals are essential for meeting the MDGs. The ICPD reproductive health goal is essential for meeting the MDGs directly related to health, social and economic outcomes, especially the child, maternal, HIV/AIDS, gender and poverty goals.

The WHO report, *Macroeconomics and Health: Investing in Health for Economic Development*, argued that health is central to economic development and that donors and poor countries must commit more resources to save lives and develop economies. It called on low and middle-income countries to increase access by the poor to essential health services. The report pointed out that, if conditions that cause avoidable deaths (including HIV/AIDS, childhood diseases and maternal conditions) were controlled, in conjunction with enhanced family planning programmes, poor families would not only enjoy longer, healthier and more productive lives, but they would also choose to have fewer children, and could therefore invest more for the education and health of each child.⁹

Resource mobilization continues to remain one of the major challenges to achieving the Cairo goals and objectives. The HIV/AIDS crisis is far worse than anticipated and infant, child and maternal mortality remains unacceptably high in many parts of the world. We cannot ignore these issues. Increased political will and a re-doubling of efforts to generate additional international assistance and increased domestic funding from all sources are urgently needed to accelerate the implementation of the ICPD Programme of Action.

^a Percentages have been rounded off and may not add to 100 per cent. An asterisk indicates primary funds of less than 0.5 and more than 0 per cent. NA indicates no report for the country in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b The 1999 figure for Australia only includes expenditures for projects exclusively dedicated to population activities and excludes expenditures for the population component in integrated development projects.

^c Information on expenditures for population projects and programmes was not provided or fully reported. As a result, 2001 project and programme figures are estimated at the 2000 level.

^d Austria and France only reported information on contributions to multilateral donors in 1999. No information on project expenditures was reported.

^e The European Union did not provide information on expenditures for population assistance in 1994; the figure reported for 1994 was obtained from data provided by other respondents.

- ^f Figures provided for 1995 represented multiple-year assistance. The 1995 figures reported here were obtained from data provided by other respondents.
- ^g Data provided by the European Union exclude NGO co-financed projects.
- ^h Data for the European Union are a global estimate based on known payment credits for population, reproductive health and AIDS activities.
- ⁱ Figures on expenditures for population assistance for 1998 were not provided. As a result, 1998 figures are estimated at the 1997 level.
- ^j Data for the European Union are a global estimate based only on the European Commission's commitments for reproductive health and AIDS activities.
- ^k Figures on expenditures for population assistance for 2000 were not provided. As a result, 2000 figures are estimated at the 1999 level.
- ^l Figures on expenditures for population assistance for 1994 were not provided. As a result, 1994 figures are estimated at the 1993 level.
- ^m Figures on expenditures for population assistance for 1995 were not provided. As a result, 1995 figures are estimated at the 1993 level, the latest year for which figures were reported.
- ⁿ Figures on expenditures for population assistance for 1997 were not provided. As a result, 1997 figures are estimated at the 1996 level.
- ^o Figures on expenditures for population assistance for 1998 were not provided. As a result, 1998 figures are estimated at the 1996 level, the latest year for which figures were reported.
- ^p Family planning assistance is included on the basis of reported commitments; for other population activities, expenditure figures were available.
- ^q Commitments for bilateral projects for Germany in 1996 amount to 168.3 million DM (\$US 111,842,082).
- ^r The figure for Germany only includes expenditures for population projects and programmes and excludes expenditures for the population component in integrated development projects.
- ^s 1999 data for Italy differ from last year's edition, due to revised figures received.
- ^t Japan used a broader definition of population assistance than the one used in this report, including funding in basic education. In the interest of comparability, the figures provided were re-calculated to conform to the definition of population assistance used in this report. If Japan's broader definition of population assistance were used, primary funds for this donor would amount to more than \$US 324 million.
- ^u Figures on expenditures for population assistance for 1996 were not provided. As a result, 1996 figures are estimated at the 1995 level.
- ^v Figures on expenditures for population assistance for 1997 were not provided. As a result, 1997 figures are estimated at the 1995 level, the latest year for which figures were reported.
- ^w Expenditures for the Netherlands are without contributions to national NGOs that receive core funding for development activities (so called "MFOs"), and without payment to experts working in the field of population activities overseas (so called "suppletie deskundigen").
- ^x Figures on expenditures for population assistance for 1995 were not provided. As a result, 1995 figures are estimated at the 1994 level.
- ^y Sweden has a much broader definition of population activities. If financial flows would be measured according to this definition, Sweden's contribution would be double.
- ^z The information provided did not always allow the unequivocal determination of the channel of distribution.
- ^{aa} Figures have been rounded off and may not add to totals.
- ^{ab} The total percentages do not add up to 100 per cent because the European Union expenditure data were not available by channel of distribution.

Table A.2. Primary funds of donor countries for population assistance as a percentage of official development assistance, 1991-2001^a

^a Figures for official development assistance (ODA) are drawn from www.oecd.org/dac/htm/dacstats.htm.

^b The 1999 figure for Australia only includes expenditures for projects exclusively dedicated to population activities and excludes expenditures for the population component in integrated projects.

^c Information on expenditures for population projects and programmes was not provided or fully reported. As a result, 2001 project and programme figures are estimated at the 2000 level.

^d Austria and France only reported information on contributions to multilateral donors in 1999. No information on project expenditures was reported.

^e Figures on expenditures for population assistance for 1994 were not provided. As a result, 1994 figures are estimated at the 1993 level.

^f Figures on expenditures for population assistance for 1995 were not provided. As a result, 1995 figures are estimated at the 1993 level, the latest year for which figures were reported.

^g Figures on expenditures for population assistance for 1997 were not provided. As a result, 1997 figures are estimated at the 1996 level.

^h Figures on expenditures for population assistance for 1998 were not provided. As a result, 1998 figures are estimated at the 1996 level, the latest year for which figures were reported.

ⁱ NA indicates no report for the country in that year.

^j Figures on expenditures for population assistance for 1996 were not provided. As a result, 1996 figures are estimated at the 1995 level.

^k Figures on expenditures for population assistance in 1997 were not provided. As a result, 1997 figures are estimated at the 1995 level, the latest year for which figures were reported.

^l Expenditures for the Netherlands are without contributions to national NGOs that receive core funding for development activities (so called "MFOs"), and without payment to experts working in the field of population activities overseas (so called "suppletie deskundigen"). If these figures would be added to the primary funds, the percentage of ODA of the Netherlands that is used for population activities would be around 4 per cent.

^m Figures on expenditures for population assistance for 1995 were not provided. As a result, 1995 figures are estimated at the 1994 level.

Table A.3. Primary funds of donor countries for population assistance per million \$US of gross national product, 1991-2001^a (\$US)

^a Figures and percentages have been rounded off and may not add to totals or 100 per cent.

^b 2000 data differ from last year's edition, due to additional information received.

^c The figure for 1993 total final expenditures includes \$US 3,178,000 reported by Sweden as a lump sum for all its bilateral expenditures in 1993.

^a Percentages have been rounded off and may not add to 100 per cent. Totals have been rounded off and may not add to Africa (sub-Saharan) Total. An asterisk in the percentage row indicates final expenditures of less than 0.5 per cent. An asterisk in the Total \$US row indicates final expenditures of less than \$US 500. A zero indicates no final expenditures. NA indicates no report for the country or region in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b Africa (sub-Saharan) Total is composed of the sum of final expenditures for population activities conducted in more than one country (Regional) plus the sum of the final expenditures for the individual countries in the region.

^c 2000 data differ from last year's edition, due to additional data received.

Table A.6. Final donor expenditures for population assistance in countries and territories of Asia and the Pacific, by channel of distribution, 1991-2001^a (Thousands of current \$US)

^a Percentages have been rounded off and may not add to 100 per cent. Totals have been rounded off and may not add to Asia and the Pacific Total. An asterisk in the percentage row indicates final expenditures of less than 0.5 per cent. An asterisk in the Total \$US row indicates final expenditures of less than \$US 500. A zero indicates no final expenditures. NA indicates no report for the country or region in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b Asia and the Pacific Total is composed of the sum of final expenditures for population activities conducted in more than one country (Regional) plus the sum of the final expenditures for the individual countries in the region.

^c 2000 data differ from last year's edition, due to additional data received.

^a Percentages have been rounded off and may not add to 100 per cent. Totals have been rounded off and may not add to Latin America and the Caribbean Total. An asterisk in the percentage row indicates final expenditures of less than 0.5 per cent. An asterisk in the Total \$US row indicates final expenditures of less than \$US 500. A zero indicates no final expenditures. NA indicates no report for the country or region in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b Latin America and the Caribbean Total is composed of the sum of final expenditures for population activities conducted in more than one country (Regional) plus the sum of the final expenditures for the individual countries in the region.

^c 2000 data differ from last year's edition, due to additional data received.

Table A.8. Final donor expenditures for population assistance in countries and territories of Western Asia and North Africa, by channel of distribution, 1991-2001^a (Thousands of current \$US)

^a Percentages have been rounded off and may not add to 100 per cent. Totals have been rounded off and may not add to Western Asia and North Africa Total. An asterisk in the percentage row indicates final expenditures of less than 0.5 per cent. An asterisk in the Total \$US row indicates final expenditures of less than \$US 500. A zero indicates no final expenditures. NA indicates no report for the country or region in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b Western Asia and North Africa Total is composed of the sum of final expenditures for population activities conducted in more than one country (Regional) plus the sum of the final expenditures for the individual countries in the region.

^c 2000 data differ from last year's edition, due to additional data received.

^a Percentages have been rounded off and may not add to 100 per cent. Totals have been rounded off and may not add to Eastern and Southern Europe Total. An asterisk in the percentage row indicates final expenditures of less than 0.5 per cent. An asterisk in the Total \$US row indicates final expenditures of less than \$US 500. A zero indicates no final expenditures. NA indicates no report for the country or region in that year. Negative numbers are due to adjustments made to the preceding year's figures and indicate that the amount of adjustment exceeded actual expenditure.

^b Eastern and Southern Europe Total is composed of the sum of final expenditures for population activities conducted in more than one country (Regional) plus the final expenditures for the individual countries in the region.

^c Includes 1992 expenditure of \$US 78,000 for Czechoslovakia. This expenditure was channelled 100 per cent through NGOs.

^d 2000 data differ from last year's edition, due to additional data received.
